Notes:

<sup>1</sup> Baseline concentrations are from samples collected in 2012 (dry weights).

<sup>2</sup> Equation used to calculate incremental soil concentration is from the US EPA (2005):  $C_s = 100 * ((DEPOSITION / (Z_s * BD))) * tD$ , where  $C_s$  = Average soil concentration over exposure duration (mg COPC/kg soil), 100 = Units conversion factor (mg-m<sup>2</sup>/kg-cm<sup>2</sup>), DEPOSITION = Yearly deposition rate of COPC from model (g/m<sup>2</sup>year),  $Z_s$  = Soil mixing zone depth (2 cm), BD = Soil bulk density (1.5 g soil/cm<sup>3</sup> soil), and tD = Time period over which deposition occurs (2 years).

<sup>3</sup> Total soil concentration is the sum of the baseline concentration and the incremental concentration.

<sup>4</sup> Sites outside the Air Quality Modeling Domain and country foods LSA are expected to have predicted metal concentrations the same baseline concentrations.

$C_s$  = Average soil concentration over exposure duration (mg COPC/kg soil)

100 = Units conversion factor (mg-m<sup>2</sup>/kg-cm<sup>2</sup>)

DEPOSITION = Yearly deposition rate of COPC from model (g/m<sup>2</sup>year)

tD = Time period over which deposition occurs (2 years)

$Z_s$  = Soil mixing zone depth (2 cm)

BD = Soil bulk density (1.5 g soil/cm<sup>3</sup> soil)

Samples where the concentration was below the detection limit were replaced with values of half the detection limit for calculation purposes.

LSA = local study area

Notes:

<sup>1</sup> Baseline concentrations are from samples collected in 2012 (dry weights).

<sup>2</sup> Equation used to calculate incremental soil concentration is from the US EPA (2005):  $C_s = 100 * ((DEPOSITION / (Z_s * BD))) * tD$ , where  $C_s$  = Average soil concentration over exposure duration (mg COPC/kg soil), 100 = Units conversion factor (mg-m<sup>2</sup>/kg-cm<sup>2</sup>), DEPOSITION = Yearly deposition rate of COPC from model (g/m<sup>2</sup>year),  $Z_s$  = Soil mixing zone depth (2 cm), BD = Soil bulk density (1.5 g soil/cm<sup>3</sup> soil), and tD = Time period over which deposition occurs (2 years).

<sup>3</sup> Total soil concentration is the sum of the baseline concentration and the incremental concentration.

<sup>4</sup> Sites outside the Air Quality Modeling Domain and country foods LSA are expected to have predicted metal concentrations the same baseline concentrations.

$C_s$  = Average soil concentration over exposure duration (mg COPC/kg soil)

100 = Units conversion factor (mg-m<sup>2</sup>/kg-cm<sup>2</sup>)

DEPOSITION = Yearly deposition rate of COPC from model (g/m<sup>2</sup>year)

tD = Time period over which deposition occurs (2 years)

$Z_s$  = Soil mixing zone depth (2 cm)

BD = Soil bulk density (1.5 g soil/cm<sup>3</sup> soil)

Samples where the concentration was below the detection limit were replaced with values of half the detection limit for calculation purposes.

LSA = local study area

Notes:

<sup>1</sup> Baseline concentrations are from samples collected in 2012 (dry weights).

<sup>2</sup> Equation used to calculate incremental soil concentration is from the US EPA (2005):  $C_s = 100 * ((DEPOSITION / (Z_s * BD))) * tD$ , where  $C_s$  = Average soil concentration over exposure duration (mg COPC/kg soil), 100 = Units conversion factor (mg-m<sup>2</sup>/kg-cm<sup>2</sup>), DEPOSITION = Yearly deposition rate of COPC from model (g/m<sup>2</sup>year),  $Z_s$  = Soil mixing zone depth (2 cm), BD = Soil bulk density (1.5 g soil/cm<sup>3</sup> soil), and tD = Time period over which deposition occurs (2 years).

<sup>3</sup> Total soil concentration is the sum of the baseline concentration and the incremental concentration.

<sup>4</sup> Sites outside the Air Quality Modeling Domain and country foods LSA are expected to have predicted metal concentrations the same baseline concentrations.

$C_s$  = Average soil concentration over exposure duration (mg COPC/kg soil)

100 = Units conversion factor (mg-m<sup>2</sup>/kg-cm<sup>2</sup>)

DEPOSITION = Yearly deposition rate of COPC from model (g/m<sup>2</sup>year)

tD = Time period over which deposition occurs (2 years)

$Z_s$  = Soil mixing zone depth (2 cm)

BD = Soil bulk density (1.5 g soil/cm<sup>3</sup> soil)

Samples where the concentration was below the detection limit were replaced with values of half the detection limit for calculation purposes.

LSA = local study area
