EXECUTIVE SUMMARY

North/South Consultants Inc. (NSC) was retained by Manitoba Transportation and Infrastructure (MTI) to collect supplemental data with respect to the aquatic environment in support of the Lake Manitoba and Lake St. Martin Outlet Channel Project (the Project). An Aquatic Effects Monitoring Program (AEMP) was developed in 2020 to provide a plan for monitoring the effects of the Project on the aquatic environment, focusing on key issues identified in the Environmental Impact Statement (EIS). The AEMP identified the need for the collection of data to supplement existing information that had been presented in the EIS.

This report presents the results of water quality sampling that was conducted in early September and mid-October 2020 to provide additional pre-construction data for the surface water quality study described in the AEMP. The surface water quality monitoring study was designed to determine whether water quality conditions change due to channel operations, specifically whether the change in flow patterns affects water quality. As such, the AEMP includes sampling locations throughout the study area. In addition to the locations identified in the AEMP, sampling described in this report was conducted at supplemental locations where historical sampling has occurred or to characterize tributaries in the study area.

In situ water quality measurements and water samples were collected at 20 core sampling sites in the study area from Lake Manitoba to Lake Winnipeg from September 1-10 and October 13-14, 2020; not all sites were sampled in October due to weather conditions. In addition, 10 sites along the alignments of the proposed Lake Manitoba Outlet Channel (LMOC) and Lake St. Martin Outlet Channel (LSMOC) were surveyed for the presence of water and *in situ* water quality in September.

Quality assurance/quality control (QA/QC) measures were incorporated into the monitoring program including standard sampling methods and QA/QC samples. All results were compared to the Manitoba Water Quality Standards, Objectives and Guidelines (MWQSOG) for the protection of aquatic life (PAL) as well as the Canadian Council of Ministers of the Environment (CCME) guidelines for the protection of freshwater aquatic life.

Based on the results collected, the water quality of the study area can be described as moderately nutrient-rich to nutrient-rich, low to moderately turbid, slightly alkaline, hard to very hard, and well-oxygenated. In general, water quality was similar at sites sampled along the main flow path from Lake Manitoba through the Fairford River to Lake St. Martin and into the Dauphin River; however, differences in water quality were observed between the sites sampled along the main flow path and Birch Creek, Big Buffalo Lake, Buffalo Creek, and Sturgeon Bay, including:

- Birch Creek had higher alkalinity, hardness, carbon, colour and magnesium, and lower conductivity, total dissolved solids (TDS), chloride, molybdenum, sodium and vanadium;
- Big Buffalo Lake had higher total phosphorus (TP), carbon, chlorophyll *a* and silicon, and lower conductivity, TDS, potassium, lithium, molybdenum, rubidium, sodium, sulphur and uranium;

- Buffalo Creek had higher carbon and silicon, and lower conductivity, TDS, potassium, lithium, molybdenum, rubidium, sodium, strontium, sulphur and uranium; and
- Sturgeon Bay had lower alkalinity, hardness, total nitrogen, carbon, antimony, boron, chloride, lithium, magnesium, molybdenum, potassium, sodium, strontium, sulphate and uranium, and higher TP, chlorophyll *a*, aluminum, cesium, chromium, copper, iron, nickel and titanium compared with sites along the main flow path.

Sampling for additional parameters was conducted at sites in the Fairford and Dauphin rivers, and Birch Creek in September which showed that *E. coli* concentrations were higher in the Fairford River than in Birch Creek or the Dauphin River; and that blue-green algae (i.e., cyanobacteria) were most abundant in the Dauphin River and least abundant in Birch Creek. Sampling was also conducted at these locations for microcystin, hydrocarbons, and pesticides; all results were below analytical detection limits.

TP exceeded the MWQSOG narrative guideline for phosphorus for lakes and river mouths (0.025 mg/L) at several locations, including: Watchorn Bay; Mercer Creek at Watchorn Bay; Fairford River at Lake St. Martin; Birch Creek at Lake St. Martin; Lake St. Martin; Big Buffalo Lake; the Dauphin River at Sturgeon Bay; and in Sturgeon Bay. TP was below the MWQSOG narrative guideline for rivers and streams (0.05 mg/L) in the Fairford and Dauphin rivers and in Birch and Buffalo creeks.

Aluminum exceeded the MWQSOG and CCME guideline for PAL (0.1 mg/L) in approximately half of the samples collected, including samples from Watchorn and Sturgeon bays, Watchorn, Birch and Buffalo creeks, the Fairford and Dauphin rivers, and Lake St. Martin. Iron exceeded the MWQSOG and CCME guideline for PAL (0.3 mg/L) in Buffalo Creek and Sturgeon Bay. Additionally, chloride exceeded the CCME long-term guideline (120 mg/L) in all samples collected from along the main flow path from Lake Manitoba through the Fairford River to Lake St. Martin and into the Dauphin River. Exceedances of these parameters are common in the region.

All other water quality variables measured for which there are MWQSOG and CCME PAL objectives or guidelines were within PAL objectives and guidelines at all core sampling sites.

Of the ten locations in natural waterbodies surveyed along the alignments of the proposed LMOC and LSMOC, three were dry and elsewhere total water depths were less than half a metre. Sites sampled along the alignment of the proposed LMOC were well oxygenated, alkaline, and had moderately high specific conductance; whereas, sites along the alignment of the proposed LSMOC were low to moderately oxygenated, circum-neutral, and had lower specific conductance. Turbidity was low at all sites sampled. At the time of the survey, dissolved oxygen (DO) was below the MWQSOG 7-day objective for cold-water aquatic life (5.0 mg/L), the MWQSOG instantaneous objective for cool-water aquatic life (5.0 mg/L), and the CCME guidelines for warm water biota (6.0 mg/L and 5.5 mg/L, for early life and all other stages, respectively) at a site located on a small creek (Creek C) upstream of the alignment of the proposed LSMOC. Additionally, pH exceeded the MWQSOG/CCME upper limit for PAL (9.0 pH units) at a small waterbody (Water Lake) along the alignment of the proposed LMOC. DO and pH were within applicable MWQSOG/CCME PAL objectives/guidelines at all other sites sampled. There are no MWQSOG/CCME PAL guidelines for the other *in situ* parameters measured.

1.0

INTRODUCTION

North/South Consultants Inc. (NSC) was retained by Manitoba Transportation and Infrastructure (MTI) to collect supplemental data with respect to the aquatic environment in support of the Lake Manitoba and Lake St. Martin Outlet Channel Project (the Project). The proposed Project is designed to manage flood waters on Lake Manitoba and Lake St. Martin by providing a channel by which flood waters can be conveyed, in addition to the natural outflow via the Fairford and Dauphin rivers (Figure 1). The Project consists of two outlet channels that are intended to work together:

- The 24 km Lake Manitoba Outlet Channel (LMOC) will work in tandem with the existing water control structure on the Fairford River (the Fairford Water Control Structure or FRWCS) to help regulate water levels and mitigate flooding on Lake Manitoba; and
- The 24 km Lake St. Martin Outlet Channel (LSMOC) will restore a more natural water regime to Lake St. Martin and will also provide flood protection by mitigating increased inflows from operation of the FRWCS, as well as additional inflows from the planned outlet from Lake Manitoba.

An Aquatic Effects Monitoring Program (AEMP) was developed in 2020 to provide a plan for monitoring the effects of the Project on the aquatic environment, focusing on key issues identified in the Environmental Impact Statement (EIS). The specific objectives of the AEMP were to:

- Verify the predicted effects presented in the surface water quality and fish and fish habitat sections of the EIS;
- Determine the effectiveness of mitigation measures;
- Assess the need for additional mitigation measures if initial measures are not adequate;
- Determine the effectiveness of any additional/adapted measure(s); and
- Confirm compliance with regulatory requirements relevant to surface water quality and fish and fish habitat set out in the Project approvals (e.g., Manitoba Environment Act License; Fisheries Act Authorization).

The AEMP identified the need for the collection of data to supplement existing information that had been presented in the EIS.

This report presents the results of water quality sampling that was conducted in early September and mid-October 2020 to provide additional pre-construction data for the surface water quality study described in the AEMP. The surface water quality monitoring study was designed to determine whether water quality conditions change due to channel operations, specifically whether the change in flow patterns affects water quality. As such, the AEMP included sampling locations throughout the study area. In addition to the locations identified in the AEMP, sampling described in this report was conducted at supplemental locations where historical sampling has occurred or to characterize tributaries in the study area (Table 1).

2.0

METHODS

2.1 SAMPLING PERIODS

Water quality sampling was conducted twice during the open-water season of 2020. Sampling periods were as follows:

- September 1-10; and
- October 13 and 14.

Sampling under ice-cover is planned for March 2021.

2.2 SAMPLING SITES

The study area for the monitoring program is comprised of Lake Manitoba, the Fairford and Dauphin rivers, Lake St. Martin, creeks and drains along the proposed LMOC alignment, the Buffalo Creek watershed, and Sturgeon Bay in Lake Winnipeg. In 2020, water quality sampling was conducted at 20 core sampling sites in the study area. Information on sampling locations is listed in Table 1 and illustrated in Figure 1 . Sampling sites were as follows:

- Two sites in Lake Manitoba in Watchorn Bay,
 - offshore of the proposed LMOC (WHB1), and
 - nearshore at the proposed LMOC (WHB2);
- One site in Watchorn Creek at Watchorn Bay (WHC-WB);
- One site in Mercer Creek at Watchorn Bay (MC-WB);
- Two sites in Birch Creek,
 - at PR 239 (BCD-2018-9), and
 - the outlet at Lake St. Martin (BC-LSM);
- Two sites in the Fairford River,
 - at highway 6 (FR1), and
 - near the outlet at Lake St. Martin (FR2);
- Five sites in Lake St. Martin,
 - Birch Bay (BB-LSM),
 - middle of the south basin (LSM5),
 - at the narrows (LSM4),
 - middle of the north basin (LSM1), and
 - the eastern bay near the proposed LSMOC (LSM3);
- Three sites in the Dauphin River,
 - at Lake St. Martin (DR-A),
 - near the provincial monitoring station at the “Big Bend” (DR-B), and
 - at Sturgeon Bay (DR-E);
- One site in Big Buffalo Lake (BBL);

- One site in Buffalo Creek at the Dauphin River (BC3); and
- Two sites in Lake Winnipeg in Sturgeon Bay,
 - nearshore at the proposed LSMOC (SB1), and
 - offshore of the proposed LSMOC (SB2).

Water quality sampling sites in Watchorn Bay (WHB1 and WHB2) and its associated creeks (WHC-WB and MC-WB), the south bay of Lake St. Martin (LSM5), two sites on the Dauphin River (DR-B and DR-E), and the sites in Sturgeon Bay (SB-1 and SB-2) were not sampled in October due to poor weather conditions, including strong winds and the early and rapid formation of ice, which made accessing the sites unsafe.

In addition to the core sampling sites described above, ten other locations along the alignments of the proposed LMOC and LSMOC were surveyed by helicopter on September 1, 2020 to ascertain the presence of water. If possible, *in situ* water quality parameters were measured. Location information for these sites is presented in Table 2 and Figure 1.

2.3 WATER QUALITY PARAMETERS

In situ measurements of physical and chemical parameters were collected at each sampling site, including: total depth; dissolved oxygen (DO); water temperature; specific conductance; pH; and turbidity. Secchi depth was also measured at sites with low water velocity.

At core sampling sites, water samples were collected for laboratory analysis of routine parameters (e.g., pH, conductivity), nutrients (e.g., nitrogen, phosphorus), chlorophyll *a*, water clarity (e.g., total suspended solids, turbidity), and metals and major ions (e.g., aluminum, iron, calcium). A detailed list of parameters analysed at core sampling sites is provided in Table 3.

During the September sampling period, selected sites were also sampled for additional parameters including: *Escherichia coli*; blue-green algae (i.e., cyanobacteria); microcystin; hydrocarbons; and pesticides. These additional parameters were analysed from samples collected at BC-LSM, FR1 and DR-A. Detailed lists of hydrocarbons and pesticides measured by the laboratory are presented in Tables 4 and 5, respectively.

In addition, samples for the laboratory analysis of biological oxygen demand (BOD) were collected from six sites during the September sampling period, including: WHC-WB; MC-WB; BCD-2018-9; BC-LSM; BBL; and BC3.

2.4 FIELD METHODS

Sampling sites were accessed by truck, boat, or helicopter depending on site accessibility. Sampling date and time were noted for each site. Sample locations were recorded using a handheld Garmin GPS receiver. Total water depth was recorded using a hand-held depth sounder at sites accessed by boat; at other sites, total water depth was estimated.

In situ measurements of water quality parameters including pH, specific conductance, DO, turbidity, and water temperature were collected using a YSI EXO™2 sonde. At river sites and those accessed from shore, *in situ* parameters were measured at approximately 0.3 m below the water's surface. At lake sites, *in situ* profiles were taken such that measurements were recorded near the surface (i.e., at 0.3 m) and at increments of either 0.5 m (if total water depth was less than 5 m) or 1.0 m. Secchi depth was measured at low velocity sites and was defined as the average of two depth readings: (1) the depth at which a circular black and white disk can no longer be seen when lowered into the water column; and (2) the depth at which the disk becomes visible again, when raised. Weather conditions (i.e., wind and waves) prohibited the collection of profiles and Secchi depths at some lake sites in September.

Grab samples were collected from approximately 0.3 m below the water's surface into clean sample bottles supplied by ALS Laboratories. Where necessary, samples were preserved according to instructions provided by the analytical laboratory. After collection, samples were placed in a cooler and kept cool using ice packs until submission (within 48 hours) to ALS Laboratories in Winnipeg, MB (a Canadian Association for Laboratory Accreditations, Inc. accredited laboratory) for analysis.

2.5 QUALITY ASSURANCE AND QUALITY CONTROL

Quality Assurance/Quality Control (QA/QC) measures were incorporated over the course of the monitoring program. Standard QA/QC measures were followed during sample collection (e.g., use of latex gloves, standard labelling practices, meter calibration, etc.). Additionally, QA/QC samples were collected for the list of parameters in Table 3 including field blanks, trip blanks, and replicate samples. For the September sampling period, two field blanks, two trip blanks and two sets of triplicate samples were submitted to the analytical laboratory. Due to the shortened sampling period in October, only one set of QA/QC samples (blanks and triplicates) was submitted.

2.5.1 Field Blanks

Field blanks are intended to provide information on sample contamination from atmospheric exposure and sample handling techniques, as well as potential laboratory contamination and/or error (British Columbia Ministry of Environment, Lands, and Parks [BCMELP] 1998). Field blanks were prepared by filling sample bottles with deionized water (both provided by the analytical laboratory) in the field and submitting the blanks along with the environmental samples.

2.5.2 Trip Blanks

Trip blanks are used for evaluating the potential for sample contamination that may occur from the container or preservatives through transport and storage of the sample, as well as laboratory precision (BCMELP 1998). Trip blanks were prepared in the laboratory by filling sample bottles with deionized water. Trip blanks were transported to the field sampling sites, but remained sealed, and were then submitted to the analytical laboratory in conjunction with environmental samples for analysis.

2.5.3 Replicate Samples

Triplicate samples were collected at two sites during the September sampling period, and one site during the October sampling period. Replicate samples provide a measure of variability of environmental conditions and the overall precision associated with field methods and laboratory analyses.

2.6 QA/QC ASSESSMENT

All water quality data were examined qualitatively for potential outliers and/or transcription or analytical errors. Where one replicate sample differed notably from the others, the measurement was flagged as “suspect” and the laboratory was asked to verify the result.

QA/QC samples were assessed according to standard criteria to evaluate precision and identify potential sample contamination issues (BCMELP 1998). Percent relative standard deviation (PRSD) was calculated for triplicate samples as follows:

$$\text{PRSD (\%)} = \text{standard deviation (SD) of the triplicate values} / \text{mean of the triplicate values} \times 100$$

Precision of replicate samples was evaluated using the “rule of thumb” criteria for precision of 18% for triplicate samples (BCMELP 1998). Where one or more of the replicate values were less than five times the analytical detection limit (DL), an analysis of precision was not undertaken, in accordance with guidance provided in BCMELP (1998).

Field and trip blank results were also evaluated for evidence of sample contamination. Values for any parameter that exceeded five times the DL were considered to be indicative of sample contamination and/or laboratory error.

2.7 DATA ANALYSIS

All data analyses treated censored values (i.e., values reported as below the DL) as equal to one half the DL. In cases where triplicate samples were collected, sample means are presented. Dissolved inorganic nitrogen (DIN) was calculated as the sum of ammonia-N and nitrate/nitrite-N. Nitrogen to phosphorus molar ratios were also calculated.

2.8 COMPARISON TO WATER QUALITY OBJECTIVES AND GUIDELINES

Results were compared to the Manitoba Water Quality Standards, Objectives and Guidelines (MWQSOG; MWS 2011) for the protection of aquatic life (PAL) as well as the Canadian Council of Ministers of the Environment (CCME) guidelines for the protection of freshwater aquatic life (CCME 1999; updated to 2020). In general, the MWQSOG for PAL are similar to the CCME guidelines for PAL for parameters measured; however, there are CCME guidelines for some parameters which lack a provincial guideline/objective and others for which the CCME and provincial guidelines are different. Typically, the

CCME guideline is more stringent than the provincial guideline. A summary of relevant water quality objectives and guidelines is presented in Appendix 1.

3.0

RESULTS

3.1 QA/QC RESULTS

QA/QC results are presented in Appendix 2.

3.1.1 Field and Trip Blanks

Field and trip blank results generally indicated high precision and no sample contamination. Although some parameters were occasionally detected in blank samples, all parameters were below the threshold of five times the DL.

3.1.2 Replicate Samples

PRSD values were not derived for several parameters due to low concentrations (i.e., concentrations less than five times the DL). In general, the results indicate good agreement between samples and acceptable levels of precision. The PRSD exceeded threshold values (18%) for four parameters, including: carbonate alkalinity; total and dissolved aluminum; and total titanium.

3.2 ROUTINE VARIABLES AND LIMNOLOGY

This section discusses the results for routine and *in situ* water quality parameters measured at the core water quality sampling sites; results of the *in situ* survey conducted on September 1, are presented separately (see Section 3.5 *In Situ* Survey Results). Results for *in situ* and routine water quality parameters measured at core sampling sites are presented in Tables 6 and 7, respectively; the following is a summary of these results.

Based on the results of the sampling that was conducted in September and October 2020, water quality of the study area can be generally described as moderately nutrient-rich to nutrient-rich, low to moderately turbid, slightly alkaline, hard to very hard, and well-oxygenated. Additionally, BOD was low at all six sites where samples were collected, including: Watchorn (WHC-WB), Mercer (MC-WB), Birch (BCD-2018-9 and BC-LSM) and Buffalo (BC3) creeks; and Big Buffalo Lake (BBL). *In situ* variables including, temperature, DO, turbidity, pH, and specific conductance were consistent across depth in Lake St. Martin. *In situ* profiles could not be collected at Watchorn and Sturgeon bays due to wavy conditions at the time of sampling.

Total phosphorus (TP) concentrations in the study area were composed of a mix of dissolved and particulate forms; in general phosphorus was predominately in particulate form. Most total nitrogen (TN) was present in organic form at all sites, with ammonia nitrogen generally comprising a greater amount of DIN than nitrate/nitrite nitrogen. Sturgeon Bay was an exception to this trend; there, DIN was dominated by nitrate/nitrite nitrogen. Based on TN:TP molar ratios, all waterbodies sampled were phosphorus limited (i.e., TN:TP ratio > 20; Kalff 2002).

Routine water quality was similar at sites sampled along the main flow path from Lake Manitoba through the Fairford River to Lake St. Martin and into the Dauphin River, including WHB1, WHB2, WHC-WB, MC-WB, FR1, FR2, BB-LSM, LSM5, LSM4, LSM1, LSM3, DR-A, DR-B and DR-E. However, differences in water quality were observed between the sites sampled along the main flow path and Birch Creek, Big Buffalo Lake, Buffalo Creek, and Sturgeon Bay. The following spatial differences in routine water quality were observed:

- Birch Creek (BCD-2018-9 and BC-LSM) had higher alkalinity, hardness, carbon and colour, and lower total dissolved solids (TDS) and conductivity than all other sites sampled;
- Big Buffalo Lake (BBL) had higher carbon and lower conductivity and TDS than sites along the main flow, and higher TP and chlorophyll *a* than all other sites sampled;
- Buffalo Creek (BC3) had higher carbon, and lower conductivity and TDS than the sites sampled along the main flow; and
- Sturgeon Bay (SB1 and SB2) had lower alkalinity, hardness, TN and carbon, and higher TP and chlorophyll *a* than upstream sites along the main flow path.

3.2.1 Comparison to Water Quality Guidelines and Objectives

TP exceeded the MWQSOG narrative guideline for phosphorus for lakes and river mouths (i.e., 0.025 mg/L) in several samples collected, including samples from the following locations:

- Watchorn Bay (WHB1 and WHB2);
- Mercer Creek at Watchorn Bay (MC-WB);
- Fairford River at Lake St. Martin (FR2);
- Birch Creek at Lake St. Martin (BC-LSM);
- Lake St. Martin at the Narrows (LSM4), the north Basin (LSM1) and eastern bay (LSM3);
- Big Buffalo Lake (BBL);
- the Dauphin River at Sturgeon Bay (DR-E); and
- Sturgeon Bay (SB1 and SB2).

TP was below the MWQSOG narrative guideline for rivers and streams (0.05 mg/L) in all samples collected from sites where the guideline applies, including FR1, BCD-2018-9, DR-A, DR-B and BC3.

DO was below the CCME PAL for early life stages of cold-water biota (9.5 mg/L) at several sites sampled in September, and at one site (BCD-2018-9) sampled in October. However, it is unlikely that early life stages of cold-water species were present at the time the measurements were taken (i.e., water temperatures were above 5°C in all instances where DO was less than 9.5 mg/L). DO was within MWQSOG objectives and CCME guidelines for PAL at all other sites and times sampled in 2020.

All other routine water quality parameters for which there are MWQSOG and CCME PAL objectives/guidelines, including, pH (6.5-9.0 pH units), ammonia (sample specific based on pH and temperature), nitrate (2.93 mg N/L and 3.0 mg/L for MWQSOG and CCME, respectively), and nitrite (0.60 mg N/L) were within PAL objectives and guidelines.

3.3 METALS AND MAJOR IONS

Metal and major ion concentrations measured in the study area are presented in Table 8.

Beryllium, bismuth, silver, tellurium, and tungsten were not detected at any site. Additionally, some metals were not detected in dissolved form at any site, including: cesium; lead; thallium; thorium; and tin. Total aluminum, arsenic, barium, boron, calcium, dissolved chloride, total iron, lithium, magnesium, total manganese, molybdenum, potassium, rubidium, dissolved selenium, silicon, sodium, strontium, dissolved sulphate, sulphur, total titanium, uranium, and total vanadium were consistently detected. The remaining metals and major ions were detected in some samples.

Like routine parameters, metals and major ions were similar at sites sampled along the main flow path from Lake Manitoba through the Fairford River to Lake St. Martin and into the Dauphin River (WHB1, WHB2, WHC WB, MC-WB, FR1, FR2, BB-LSM, LSM5, LSM4, LSM1, LSM3, DR-A, DR-B and DR-E); however, differences were observed between the sites sampled along the main flow path and Birch Creek, Big Buffalo Lake, Buffalo Creek, and in particular Sturgeon Bay. The following spatial differences in metals and major ions were observed:

- Birch Creek (BCD-2018-9 and BC-LSM) had lower chloride, molybdenum, sodium and vanadium, and higher magnesium;
- Big Buffalo Lake (BBL) had lower potassium, lithium, molybdenum, rubidium, sodium, sulphur and uranium, and higher silicon;
- Buffalo Creek (BC3) had lower potassium, lithium, molybdenum, rubidium, sodium, strontium, sulphur and uranium, and higher silicon; and
- Sturgeon Bay (SB1 and SB2) had lower antimony, boron, chloride, lithium, magnesium, molybdenum, potassium, sodium, strontium, sulphate, and uranium, and higher aluminum, cesium, chromium, copper, iron, nickel and titanium than sites sampled along the flow path from Lake Manitoba through the Dauphin River.

3.3.1 Comparison to Water Quality Guidelines and Objectives

Metals and major ions for which there are MWQSOG or CCME guidelines for PAL were, with few exceptions, within objectives and guidelines at sites sampled in 2020; PAL exceedances occurred for aluminum, chloride and iron as described below. Exceedance of PAL guidelines for aluminum and iron are common in waterbodies throughout Manitoba (CAMP 2017) and exceedance of the CCME PAL for chloride was regularly observed in the study area during the monitoring studies conducted for the Lake St. Martin Emergency Outlet Channel project (NSC and KGS Group 2016).

Aluminum exceeded the MWQSOG and CCME guideline for PAL (0.1 mg/L) in 15 of 29 samples collected, including samples from the following locations:

- Watchorn Bay (WHB1 and WHB2);
- Watchorn Creek (WHC-WB);
- Birch Creek at PR239 (BCD-2018-9);

- Fairford River (FR1 and FR2);
- Lake St. Martin (BB-LSM, LSM1 and LSM3);
- Buffalo Creek (BC3);
- Dauphin River (DR-E); and
- Sturgeon Bay (SB1 and SB2).

Iron exceeded the MWQSOG and CCME guideline for PAL (0.3 mg/L) in the samples collected from Buffalo Creek (BC3) and Sturgeon Bay (SB1 and SB2) in September; these sites were not sampled in October. Iron was below PAL guidelines at all other sites sampled.

Chloride exceeded the CCME long-term guideline (120 mg/L) in all samples collected from Watchorn Bay (WHB1 and WHB2), Watchorn and Mercer creeks (WHC-WB and MC-WB), Lake St. Martin (LSM5, LSM4, LSM1 and LSM3), and the Fairford (FR1 and FR2) and Dauphin (DR-A, DR-B and DR-E) rivers; all concentrations were below the CCME short-term guideline (640 mg/L). Chloride was below CCME PAL guidelines in all other sites sampled. There are no MWQSOG for PAL for chloride.

3.4 ADDITIONAL PARAMETERS

This section presents the results for the additional parameters that were analyzed in samples collected from Birch Creek at Lake St. Martin (BC-LSM), the Fairford River at PTH 6 (FR1), and the Dauphin River at Lake St. Martin (DR-A) in September 2020, including: *E. coli*; blue-green algae; microcystin; hydrocarbons; and pesticides. Detailed results are available in Appendix 3, the following is a summary of these results:

- *E. coli* was detected at all three sites sampled and concentrations were higher in the Fairford River (308 MPN/100 mL) than in Birch Creek (9 MPN/100 mL) and the Dauphin River (2 MPN/100 mL);
- blue-green algae were most abundant in the Dauphin River and least abundant in Birch Creek (Figure 2);
- microcystin was not detected (DL = 0.20 µg/L) at any of the three sites;
- hydrocarbons and were not detected at any of the three sites; and
- pesticides were not detected at any of the three sites.

For a list of hydrocarbons and pesticides measured including DLs, see Tables 4 and 5, respectively.

3.4.1 Comparison to Water Quality Guidelines and Objectives

As all results for hydrocarbons and pesticides were below detection and the DLs were lower than MWQSOG and CCME PAL guidelines, all measurements were also within the PAL guidelines.

There are no MWQSOG or CCME guidelines for PAL for *E. coli*, blue-green algae, or microcystin.

3.5 IN SITU SURVEY RESULTS

This section presents the results of the *in situ* survey that was conducted at ten locations in the study area on September 1, 2020. Results from this survey are presented in Table 9.

Of the ten locations surveyed, three sites along the alignment of the proposed LMOC were dry, including: Goodison Lake, Clarks Drain; and Woodale Drain. Water was present at the outlet of the drain at Goodison Lake; however, *in situ* parameters were not measured. All other sites surveyed were quite shallow with total water depths less than 0.5 m.

Sites along the alignment of the proposed LMOC where water was found (i.e., Reed, Clear and Water lakes) were well oxygenated, alkaline, and had low turbidity. Specific conductance was moderately high and ranged from 470-802 µS/cm.

Sites sampled along the alignment of the proposed LSMOC were low to moderately oxygenated, circum-neutral, and had low turbidity. Specific conductance at these sites was lower (8-367 µS/cm) than at the sites sampled along the alignment of the proposed LMOC.

3.5.1 Comparison to Water Quality Guidelines and Objectives

DO was below the MWQSOG 7-day objective for cold-water aquatic life (5.0 mg/L), the MWQSOG instantaneous objective for cool-water aquatic life (5.0 mg/L), and the CCME guidelines for warm water biota (6.0 mg/L and 5.5 mg/L for early life and all other stages, respectively) at the site located on Creek C upstream of the alignment of the proposed LSMOC (4.15 mg/L). Additionally, DO was below the CCME PAL for early life stages of cold-water biota (9.5 mg/L) at all sites sampled along the alignment of the proposed LSMOC; however, it is unlikely that early life stages of cold-water species were present at the time the measurements were taken (i.e., water temperatures were above 5°C in all instances where DO was less than 9.5 mg/L). DO was within MWQSOG objectives and CCME guidelines for PAL at all sites sampled along the alignment of the proposed LMOC.

In situ pH exceeded the MWQSOG/CCME upper limit for PAL (9.0 pH units) at Water Lake (9.68 pH units); pH was within MWQSOG/CCME PAL guidelines (6.5-9.0 pH units) at all other sites sampled.

There are no MWQSOG/CCME PAL guidelines for the other *in situ* parameters measured.

4.0

SUMMARY

Based on the results of the monitoring that was conducted in September and October 2020, the water quality of the study area can be described as moderately nutrient-rich to nutrient-rich, low to moderately turbid, slightly alkaline, hard to very hard, and well-oxygenated. In general, water quality was similar at sites sampled along the main flow path from Lake Manitoba through the Fairford River to Lake St. Martin and into the Dauphin River; however, differences in water quality were observed between the sites sampled along the main flow path and Birch Creek, Big Buffalo Lake, Buffalo Creek, and Sturgeon Bay, including:

- Birch Creek had higher alkalinity, hardness, carbon, colour and magnesium, and lower conductivity, TDS, chloride, molybdenum, sodium and vanadium;
- Big Buffalo Lake had higher TP, carbon, chlorophyll *a* and silicon, and lower conductivity, TDS, potassium, lithium, molybdenum, rubidium, sodium, sulphur and uranium;
- Buffalo Creek had higher carbon and silicon, and lower conductivity, TDS, potassium, lithium, molybdenum, rubidium, sodium, strontium, sulphur and uranium; and
- Sturgeon Bay had lower alkalinity, hardness, TN, carbon, antimony, boron, chloride, lithium, magnesium, molybdenum, potassium, sodium, strontium, sulphate and uranium, and higher TP, chlorophyll *a*, aluminum, cesium, chromium, copper, iron, nickel and titanium compared with sites along the main flow path.

The results of the additional sampling that was conducted in the Fairford and Dauphin rivers, and Birch Creek in September showed that *E. coli* concentrations were higher in the Fairford River than in Birch Creek or the Dauphin River; and that blue-green algae were most abundant in the Dauphin River and least abundant in Birch Creek. Microcystin, hydrocarbons, and pesticides were not detected.

TP exceeded the MWQSOG narrative guideline for phosphorus for lakes and river mouths at several locations, including: Watchorn Bay; Mercer Creek at Watchorn Bay; Fairford River at Lake St. Martin; Birch Creek at Lake St. Martin; Lake St. Martin; Big Buffalo Lake; the Dauphin River at Sturgeon Bay; and in Sturgeon Bay. TP was below the MWQSOG narrative guideline for rivers and streams in the Fairford and Dauphin rivers and in Birch and Buffalo creeks.

Aluminum exceeded the MWQSOG and CCME guideline for PAL in approximately half of the samples collected, including samples from Watchorn and Sturgeon bays, Watchorn, Birch and Buffalo creeks, the Fairford and Dauphin rivers, and Lake St. Martin. Iron exceeded the MWQSOG and CCME guideline for PAL Buffalo Creek and Sturgeon Bay. Additionally, chloride exceeded the CCME long-term guideline in all samples collected from along the main flow path from Lake Manitoba through the Fairford River to Lake St. Martin and into the Dauphin River. Exceedances of these parameters are common in the region.

All other water quality variables measured for which there are MWQSOG and CCME PAL objectives or guidelines were within PAL objectives and guidelines at all core sampling sites.

The *in situ* survey that was conducted on September 1, 2020 found that, of the ten locations surveyed, three were dry (Goodison Lake, and Clarks and Woodale drains) and elsewhere total water depths were

less than half a metre. Sites along the alignment of the proposed LMOC (where water was found) were well oxygenated, alkaline, and had moderately high specific conductance; whereas, sites along the alignment of the proposed LSMOC were low to moderately oxygenated, circum-neutral, and had lower specific conductance. Turbidity was low at all sites sampled. At the time of the survey, DO was below the MWQSOG 7-day objective for cold-water aquatic life, the MWQSOG instantaneous objective for cool-water aquatic life, and the CCME guidelines for warm water biota at the site located on Creek C upstream of the alignment of the proposed LSMOC. Additionally, pH exceeded the MWQSOG/CCME upper limit for PAL at Water Lake. DO and pH were within applicable MWQSOG/CCME PAL objectives/guidelines at all other sites sampled. There are no MWQSOG/CCME PAL guidelines for the other *in situ* parameters measured.

APPENDIX 1. WATER QUALITY OBJECTIVES AND GUIDELINES

WATER QUALITY OBJECTIVES AND GUIDELINES

The following is a summary of applicable water quality objectives and guidelines for evaluation of water chemistry data collected in the study area, including: the Manitoba Water Quality Standards, Objectives, and Guidelines (MWQSOG) for the protection of aquatic life (PAL; MWS 2011); and the Canadian Council of Ministers for the Environment (CCME) guidelines for the protection of freshwater aquatic life (CCME 1999, updated to 2020).

AMMONIA

Both MWQ objectives and CCME guidelines for PAL exist for ammonia; these criteria are dependent upon water temperature and pH. A representative range of Manitoba water quality objectives and CCME guidelines for ammonia appropriate for the range of pH and temperature measured in the study area (i.e., site-specific objectives) in 2020 are presented in Tables A1-1 and A1-2, respectively.

Table A1-1. Range of applicable Manitoba Water Quality Objectives for ammonia, for the protection of cool-water and cold-water aquatic life and wildlife.

Water Use	pH	Temperature (°C)	Manitoba Water Quality Objective (mg N/L) ¹		
			30-day	4-day	1-hour
<u>Cool water aquatic life, early life stages present</u>					
	7.62	4.73	3.90	9.74	16.5
		16.2	3.49	8.74	16.5
	8.42	4.73	1.25	3.12	3.74
		16.2	1.12	2.80	3.74
<u>Cool water aquatic life, early life stages absent</u>					
	7.62	4.73	6.33	15.8	16.5
		16.2	3.49	8.74	16.5
	8.42	4.73	2.02	3.74	3.74
		16.2	1.12	3.74	3.74
<u>Cold water aquatic life, early life stages present</u>					
	7.62	4.73	3.90	9.74	11.0
		16.2	3.49	8.74	11.0
	8.42	4.73	1.25	2.49	2.49
		16.2	1.12	2.49	2.49
<u>Cold water aquatic life, early life stages absent</u>					
	7.62	4.73	6.33	11.0	11.0
		16.2	3.49	8.74	11.0
	8.42	4.73	2.02	2.49	2.49
		16.2	1.12	2.49	2.49

¹ - Values calculated from algorithms provided in MWS (2011) and the range of pH and water temperature measured in the study area in 2020. The most stringent objective is indicated in red.

Table A1-2. CCME water quality guidelines for total ammonia for the protection of freshwater aquatic life.

Temperature (°C)	CCME water quality guideline (mg N/L) ¹				
	pH				
	7.0	7.5	8.0	8.5	9.0
0	19.0	6.02	1.92	0.616	0.206
5	12.6	3.98	1.27	0.413	0.141
10	8.47	2.68	0.855	0.282	0.100
15	5.74	1.83	0.588	0.197	0.073
20	3.96	1.27	0.410	0.141	0.055

1. - Guidelines presented are for the range of pH and water temperature measured in the study area in 2020. The most stringent guideline is indicated in red.

DISSOLVED OXYGEN

Manitoba objectives for dissolved oxygen (DO) are dependent upon water temperature, the presence of early life stages, and the presence of sensitive fish species (e.g., cool-water fish such as Northern Pike and Walleye or cold-water fish species such as Lake Whitefish, MWS 2011). Objectives, which are specific for early life stages and mature life stages and vary according to the averaging duration, are presented in Table A1-3. Similarly, the CCME lowest acceptable level of DO varies by warm/cold water biota and life stage, as shown in Table A1-4.

Table A1-3. Manitoba Water Quality Objectives for dissolved oxygen.

Applicable Conditions	Dissolved Oxygen Objective (mg/L)			
	Averaging Duration			
	Instantaneous Minimum	7 Day Minimum	7 Days	30 Days
<u>Cold-Water Aquatic Life and Wildlife</u>				
Water Temperature ≤ 5°C and Early Life Stages Present	8.0	-	9.5	-
Water Temperature > 5°C and Mature Life Stages Present	4.0	5.0	-	6.5
<u>Cool-Water Aquatic Life and Wildlife</u>				
Water Temperature ≤ 5°C and Mature Life Stages Present	3.0	4.0	-	5.5
Water Temperature > 5°C and Early Life Stages Present	5.0	-	6.0	-

Table A1-4. CCME lowest acceptable concentration of dissolved oxygen for the protection of freshwater aquatic life.

	Dissolved Oxygen Value (mg/L)	
	Early life stages	Other life stages
Warm water biota	6.0	5.5
Cold water biota	9.5	6.5

TOTAL SUSPENDED SOLIDS AND TURBIDITY

MWQSOG and CCME guidelines for PAL for total suspended solids (TSS) are similar and allow the following: a maximum increase of 25 mg/L from background for short term exposure (up to 24 hrs.); an average increase of 5 mg/L from background for long term exposure (i.e., 1 to 30 days); a maximum increase of 25 mg/L from background when background TSS is between 25 mg/L and 250 mg/L; and a maximum change of 10% from background when TSS greater than 250 mg/L.

There are different criteria for turbidity for the MWQSOG and CCME guidelines for PAL. The Manitoba objective for turbidity for PAL is for “equivalent induced levels of change as calculated from site-specific or regional-specific correlation between total suspended solids and turbidity” (MWS 2011). The CCME guideline is more definitive and allows for the following (CCME 1999, updated to 2020) a maximum increase of 8 NTU from background for short term exposure (up to 24 hrs.); an average increase of 2 NTU from background for long term exposure (i.e., 1 to 30 days); a maximum increase of 8 NTU from background when background TSS is between 8 NTU and 80 NTU; and a maximum change of 10% from background when background is greater than 80 NTU.

There is also a MWQSOG maximum acceptable concentration of 1.0 NTU for drinking water. However, this guideline, as with all drinking water guidelines/objectives, is to be applied to finished drinking water; and, since the majority of natural surface waters will exceed this guideline it has not been included in this assessment.

PHOSPHORUS

MWQSOG include narrative guidelines for total phosphorus (TP) which state: “[TP] should not exceed 0.025 mg/L in any reservoir, lake, or pond, or in a tributary at the point where it enters such bodies of water. In other streams, [TP] should not exceed 0.05 mg/L” (MWS 2011).

CCME guidelines for the protection of freshwater aquatic life provide a guidance framework for the development of site-specific guidelines; this is a detailed process that requires sufficient baseline data for guideline development and is beyond the scope of this report.

OTHER ROUTINE PARAMETERS

Table A1-5 presents water quality criteria for other routine parameters not discussed above.

METALS AND MAJOR IONS

Table A1-6 presents water quality criteria for select metals and major ions.

HYDROCARBONS

Table A1-7 presents water quality criteria for select hydrocarbons.

PESTICIDES

Table A1-8 presents water quality criteria for select pesticides.

Table A1-5. Manitoba and CCME guidelines for the protection of aquatic life for other routine parameters measured.

Parameter	Guidelines/Objectives for PAL		
	MWQSOG ¹	CCME ²	
		Short Term	Long Term
Nitrate	2.93 mg N/L ³	124 mg N/L	3.0 mg N/L
Nitrite	0.060 mg N/L	-	0.060 mg N/L
pH	6.5 to 9.0	-	6.5 to 9.0

1 - Manitoba Water Quality Standards, Objectives, and Guidelines (MWS 2011).

2 - CCME guidelines for the protection of freshwater aquatic life (CCME 1999, updated to 2020).

3 - The Manitoba PAL guideline for nitrate indicated in MWS (2011) was incorrectly identified as 13 mg N/L. The PAL guideline should read 2.93 mg N/L (N. Armstrong, Pers. Comm.).
