Executive Summary

Canada Nickel Company (Canada Nickel) proposes to develop, construct, operate, and progressively reclaim a new open pit nickel mine and processing facility, collectively known as the Crawford Nickel Project ('the Project'), approximately 42 kilometres (km) north of Timmins, Ontario. This Surface Water Resources Baseline Report has been completed to inform the Impact Statement. It has been prepared pursuant to the *Impact Assessment Act,* 2019 and in consideration of the Tailored Impact Statement Guidelines: Crawford Nickel Project. This report establishes the climatic, hydrologic, and water quality setting of the Project.

Climate variables summarized in this report include air temperature, precipitation, snowfall, and climate change impact modelling. Climate data was obtained from relevant Environment and Climate Change Canada (ECCC) climate stations and a 1991 – 2020 climate normal was developed following ECCC methods. The 1 normal annual precipitation is 801.8 mm with snow cover typically starting in October and ending in April. Using a Thornthwaite environmental water balance, annual actual evapotranspiration is estimated to be 473.4 for climate normal conditions.

Three climate change scenarios were modelled to characterize the future climate conditions of the site during the 2071-2100 period. These scenarios are identified as unique Shared Socioeconomic Pathways (SSP), which are defined by the Intergovernmental Panel on Climate Change (IPCC). The moderate emissions scenario is represented by the SSP2-4.5 scenario. Results of the climate change models indicate that the future of the Project site can expect rainfall and air temperature to increase. A comparison of the climate change adjusted intensity-duration-frequency (IDF) curves to climate normal IDF curves identified that storms of various durations and return periods increased in rainfall depth on average by 22.7% for emission scenario SSP2-4.5. Temperature changes are estimated for the 2071-2100 period based on a SSP2-4.5 scenario, relative to a 1971 – 2000 baseline period. Summer, spring and fall temperatures are expected to increase by 3.7ºC. Winter temperatures are expected to increase by 5.3ºC.

Regional hydrologic variables addressed by the baseline report include annual flows, monthly flows, peak flows, low flows and environmental flows using extensive historic datasets for the region. Regional relationships were developed for annual flows, peak and low flows and environmental flows using hydrometric station data from applicable Water Survey of Canada (WSC) hydrometric stations.

Monthly and annual flow regressions were developed for the five selected regional WSC stations. The regression equations were then applied to the watersheds of the Project site area. The coefficient of determination (R^2) between flow and catchment area for mean annual flow (MAF) was 0.99 indicating a high level of correlation. The R^2 value for the mean monthly flow (MMF) regressions ranged from 0.897 and 0.996, with a mean of 0.97 indicating a high level of correlation.

The regional relationships for peak flows (2, 5, 10, 25, 50-and 100-year return periods), low flows (7Q10, and 7Q20) and flow duration curves were developed. The R^2 values for peak flow regression ranged from 0.76-0.82, and values for 7Q10 and 7Q20 were 0.893 and 0.886, respectively.

A Thornthwaite environmental water balance for the PA was developed for 1991-2020 climate normal, wettest recorded year and driest recorded year. The climate normal, driest and wettest year annual actual evapotranspiration is estimated to be 473 mm, 453 mm and 510 mm, respectively. The climate normal total groundwater recharge (infiltration) estimated for the project site is 164.1 mm/year, which is 28.7% of the total precipitation amount. The climate normal total stream flow estimate of 328.2 mm represents a streamflow (runoff) coefficient of 41%.

The regional assessment determined that baseflows annually contribute to 30% of total streamflow, increasing to 59% during winter months.

The Project site has established hydrometric stations to monitor continuous watercourse flows and lake water levels using water level dataloggers and periodic manual flow measurements. Hydrometric monitoring was conducted from 2021 to 2023 at 11 stations, including two stations performing lake level monitoring. *In situ* flow measurement results, rating curves, and station hydrographs for each applicable station were developed and presented. Hydrometric station watershed areas ranged from 7.2 to 199 km^2 and ice free condition *in situ* flow measurements were used to develop rating curves at seven stations.

The development of hydrological model (HEC-HMS) of the three site watersheds was developed and calibrated using prorated flows from a nearby WSC streamflow monitoring station (Porcupine River at Hoyle, # 04MD004). The developed model was able to represent baseflows, spring freshet flow peaks and adequately represented precipitation events recorded.

Regional and local water quality assessments were conducted to analyze and describe water quality conditions in the Project Area (PA). Regional water quality data was obtained from seven Provincial Water Quality Monitoring Network stations. In the PA, a total of 317 surface water quality samples were collected from 2021 to December 2023 at 33 watercourse locations and 13 waterbody locations across three main watersheds (Jocko Creek, North Driftwood River and West Buskegau River). To facilitate data analysis and discussion, results were assessed by grouping monitoring stations located in waterbodies and watercourses. Monitoring locations were also aggregated by watershed and were assessed for water quality relationships of surface water feature type, watershed and seasonality.

Water quality samples were collected and analyzed for general chemistry, nutrients, chrysotile asbestos, total suspended solids (TSS), cyanide, and total and dissolved metals. Temperature, dissolved oxygen, specific conductivity, pH, colour, odour and visual observations were measured *in situ* using a calibrated multi-parameter water quality meter. Temperature and dissolved oxygen profiles at regular depth intervals were monitored in six lakes. Results were compared to Canadian Council of Ministers of Environment (CCME) water quality guidelines for protection of freshwater aquatic life (CCME CWQGs-FAL) and Ontario provincial water quality objectives (PWQOs).

Six lakes had temperature and dissolved oxygen profiles measured at regular intervals and during the summer and early fall months in 2022 to 2023, which were observed to be thermally stratified with low oxygen to anoxic hypolimnions.

Local general water quality in the watercourses and waterbodies identified slightly acidic conditions with 25th percentile values below the CWQG-FAL and PWQO lower limit (6.5). Alkalinity is relatively low with limited acid buffering potential. Waters within the PA are typically classified as medium hard with soft waters in the Jocko Creek and West Buskegau River watersheds.

Three parameters were identified as parameters of potential concern (PoPCs) where local watercourse and waterbody 75th percentile values exceeded the corresponding guideline, in particular the PWQOs. Total phosphorus (TP) had a 75th percentile value of 0.032 mg/L for watercourses and 0.021 mg/L for waterbodies with PWQO TP values of 0.030 mg/L and 0.020 mg/L, respectively. For the assessment of aluminum, CWQG-FAL criteria was used to evaluate total aluminum and PWQO criteria (clay-free samples) used to evaluate dissolved aluminum. The 75th percentile value for dissolved aluminum exceeded the PWQO criteria of 75 µg/L for the 0.2 µm filtered samples, with a value of 107 µg/L in watercourses. Total iron is identified as a Parameter of Potential Concern (PoPC) as the 75th percentile values of both the watercourses and waterbodies exceeded the CWQG-FAL and PWQO value of 300 µg/L. There were no substantial differences in water quality parameter results between the three watersheds in the PA (Jocko Creek, North Driftwood River, and the West Buskegau River).

Other metals and metalloids that reported at least one exceedance of the applicable guideline values as part of the local watercourse and waterbody monitoring program include: total cadmium, total cobalt, total copper, total lead, dissolved manganese, mercury, total selenium, total silver, total zinc and total zirconium.

Aggregated water quality data by water feature type, specifically watercourses (including streams, rivers, and creeks) and waterbodies (lakes and ponds), observed typically lower concentrations of nutrients, metals and metalloids in waterbodies compared to watercourses with fewer regulatory guideline exceedances.

Comparison of the local and regional water quality datasets identified total phosphorus, total aluminum, and total iron as common PoPCs. Regional water quality data identified additional PoPCs that were not observed in the local data and are not considered PoPCs in the PA were total arsenic, total cadmium, total cobalt, total copper, total lead, total silver and total zinc. Both the regional and local water quality exhibited seasonal trends for various parameters. Concentrations of parameters were typically higher in the late fall and winter months and lower in the spring and summer months (total ammonium/total ammonia (as N), TP, aluminum, iron, lead and zinc). A 95th percentile confidence interval was calculated for both local and regional datasets with the regional dataset typical having greater variability potentially due to the longer monitoring period.

1 Introduction

Canada Nickel Company (Canada Nickel) proposes to develop, construct, operate, and progressively reclaim a new open pit nickel mine and processing facility, collectively known as the Crawford Nickel Project ('the Project'), approximately 42 kilometres (km) north of Timmins, Ontario. The Project is being assessed in accordance with the *Impact Assessment Act*, 2019.

Stantec Consulting Ltd. (Stantec) has been retained by Canada Nickel to conduct an assessment of surface water resources for the Project. This Surface Water Resources Baseline Report has been completed to inform the Impact Statement. It has been prepared pursuant to the *Impact Assessment Act,* 2019 and in consideration of the Tailored Impact Statement Guidelines: Crawford Nickel Project (Appendix A.1 of the Impact Statement).

The information presented in this report is intended to summarize and document the existing conditions of surface water resources, to support the preparation of the Impact Statement.

The information presented herein was obtained from publicly available federal and provincial resources for hydrological, climate, and physiographic data and from local project hydrology and water quality monitoring programs.

1.1 Project Location and Setting

The Project is located approximately 42 km north of the City of Timmins, Ontario, in the geographic townships of Crawford, Carnegie, Kidd, Lucas, Beck, Nesbitt, Wark, and Prosser (Figure A.1, Appendix A). A small portion of the Project extent within the geographic townships of Kidd and Wark also lies within the municipal boundary of the City of Timmins.

1.2 Project Overview

The Project includes the development of an Open Pit, Stockpiles, two ore processing plants, and other mine related infrastructures, as well as new rail spur line and the relocation of Highway 655 and 500 kilovolt transmission line. Ore will be extracted from a single Open Pit that will be divided into an East Zone and Main Zone. The Project has a mineral reserve estimate of 1,715 million tonnes and an expected project life of 41 years.

The Crawford Project site is located approximately 42 km north of the City of Timmins, Ontario, in the geographic townships of Crawford, Carnegie, Kidd, Lucas, Beck, Nesbitt, Wark and Prosser. A small portion of the Project extent within the geographic townships of Kidd and Wark also lies within the municipal boundary of the City of Timmins.

Based on the current Project design, the maximum rate of ore extraction will be up to 240,000 tonnes per day (tpd) during year 5 of operations and an average rate of 160,000 tpd over the life of mine. The two ore Processing Plants and associated service facilities will process run of mine ore delivered to primary

crushers to produce nickel concentrate, iron concentrate, and tailings at a rate of approximately 60,000 tpd at the start of mine life, ramping up to a maximum of 120,000 tpd. In addition to nickel and iron, other metals such as cobalt, chromium, palladium and platinum are expected to be recovered from concentrate streams.

Based on the proposed processing rate and current information regarding the ore body, the current life of the proposed Project is expected to be approximately 41 years. Mining would be completed at a faster pace than milling, thus mining of ore would occur for about 30 years, then milling alone for the last 11 years.

Concentrate from the processing plants will be loaded onto rail cars and shipped via the rail spur line for refinement offsite.

1.3 Study Objectives

The Surface Water Resources Baseline Report provides information to inform the Impact Statement for the Project. The objectives of this report are to describe and present available information on baseline conditions in the study area. The scope of the Surface Water Resources Baseline Report includes the following:

- Collect and review available information and data
- Conduct applicable field work
- Analyze baseline hydrologic and water quality conditions

To facilitate reference between this baseline report and the corresponding federal Tailored Impact Statement (TIS) Guidelines, a concordance table has been developed (Table 1.1).

Table 1.1 Concordance Table for Topics Listed in Tailored Impact Statement Guidelines

Guideline Information Requested	Addressed in Report Section
Hydrology	
Hydrometeorological information (temperature, precipitation, evapotranspiration), based on data from nearby weather stations.	Sections 4.1.1.1 and 5.1.7
Describe and illustrate on one or more topographic maps, at appropriate scales, the drainage basins in relation to key project components. On the map(s), identify waterbodies and watercourses, including intermittent streams, flood risk areas, wetlands, watershed and subwatershed boundaries, and direction of flow.	Sections 4.1.1.2, 4.1.4.2.1, 5.2.3 and 5.2.4 Wetlands – refer to the Vegetation, Riparian and Wetland Environments Supplemental Baseline Report (Appendix B.7.1 of the Impact Statement) Additional information on waterbodies and watercourses – refer to the 2021-2023 Fish and Fish Habitat Baseline (Appendix B.8.2 of the Impact Statement) and the Fish and Fish Habitat Supplemental Baseline Report (Appendix B.8.1 of the Impact Statement)

Guideline Information Requested	Addressed in Report Section
List waterbodies and watercourses (permanent, intermittent, and ephemeral) that may be directly or indirectly affected by the Project.	Sections 5.1.5 and 5.2.3
Provide a table that groups waterbodies and watercourses by subwatershed and provide information about the type and size of the waterbodies and watercourses.	Sections 4.2.1, 5.2.3.1, 5.2.3.3, Appendices B.1 and B.2
Flow hydrographs and corresponding water levels for nearby streams and rivers including any site-specific rating curves (and manually collected flow/level data).	Sections 4.2.1, 5.2.3.1 and Appendix B.2
Stage hydrographs for lakes expected to be affected by the Project showing the full range of seasonal and inter-annual water level variations.	Sections 4.2.1, 5.2.3.1 and Appendix B.2
A description of ice cover, thickness and conditions and the timing of freeze-thaw cycles for each waterbody and watercourse potentially affected by the Project.	Sections 4.2.1 and 5.2.3.1
Each waterbody potentially affected by the Project, including bathymetry, maximum and mean depths, vertical profile information, information on stratification and turnover, and sediment composition (e.g., particle size analysis and sediment quality).	Waterbody bathymetry - Sections 4.2.1 and 5.3.2 Vertical profile, stratification and turnover information – Sections 4.2.2.2.1, 5.3.2.1.1 and Figure A.14 in Appendix A Additional information on waterbody bathymetry refer to the 2021-2023 Fish and Fish Habitat Baseline (Appendix B.8.2 of the Impact Statement) and the Fish and Fish Habitat Supplemental Baseline Report (Appendix B.8.1 of the Impact Statement) Information on sediment composition refer to the 2021-2023 Fish and Fish Habitat Baseline (Appendix B.8.2 of the Impact Statement) and the Fish and Fish Habitat Supplemental Baseline Report (Appendix B.8.1 of the Impact Statement)
Present a conceptual model for the hydrological environment, as appropriate to describe baseline conditions for surface waters. The model should be developed to support the assessment of potential changes to water and sediment quantity and quality in watercourses, waterbodies, and wetlands, with input from regulators and Indigenous nations.	Conceptual model (Regional hydrology assessment) – Sections 4.1.2, 4.1.3, 5.2.1, 5.2.2 and Appendix B.4 Hydrologic model - Sections 4.1.4, 5.2.3.4 and Appendix B.1
Surface Water Quality	
Describe the surface water quality baseline characterization program, including sampling site selection and locations (upstream, within the zone of influence of the Project, and downstream), monitoring duration and frequency, sampling methodology, and analytical protocol, including quality assurance and quality control measures. • characterization program should include sampling locations within the PA, LSA, and RSA, and should include reference locations that are unlikely to be impacted by the Project.	Sections 4.1.5, 4.2.2, 5.3 and Appendices B.5, B.6, B.7, B.8 and B.9

Guideline Information Requested	Addressed in Report Section
Provide baseline data for relevant physicochemical parameters and chemical constituents for surface water quality. • physicochemical parameters may include temperature, pH, electrical conductivity, dissolved oxygen, turbidity, total suspended solids, total hardness, total dissolved solids. • relevant chemical constituents may include major and minor ions, total and dissolved trace metals (including arsenic), radionuclides, total mercury, methylmercury, polycyclic aromatic compounds, nutrients, organic and inorganic compounds, or other compounds of potential concern. • water sample collection and analysis should use appropriately sensitive detection limits and the data should illustrate the seasonal and inter-annual variability in baseline surface water quality with sufficient years of baseline data to fully characterize natural variability, including possible variabilities due to groundwater–surface water interactions.	Sections 4.1.5, 4.2.2, 5.3 and Appendices B.5, B.6, B.7, B.8 and B.9
Describe baseline concentrations for relevant physicochemical parameters and chemical constituents in relation to applicable water quality guidelines.	Sections 4.1.5, 4.2.2, 5.3 and Appendices B.5, B.6, and B.7
Describe springs and any other potable surface water resources within the PA as required, and describe their current use, potential for future use, and whether their consumption has Indigenous cultural importance.	Section 5.1.6 Additional information on Indigenous cultural importance in the Assessment of Potential Effects on Indigenous Interests (Chapters 25 to 28 of the Impact Statement)

2 Regulatory Setting

There are several federal and provincial regulatory requirements that may apply to the Project, including environmental assessment and other environmental permitting obligations.

2.1 Federal Requirements

The Project is being assessed in accordance with the *Impact Assessment Act, 2019*.

The requirements to consider potential Project effects on surface water resources are described in Section 8.6 of the TIS Guidelines for the Project.

Fisheries Act

There are several sections and subsections of the *Fisheries Act* that pertain to surface water and potential interactions with the Project; these are listed below:

- *Fisheries Act*, sections 34.3, 34.4(1), 35(1) and 36(3) - The federal *Fisheries Act* requires the protection of fish habitat and prohibits deposit of deleterious substance in all watercourses that are fish bearing
- Metal and Diamond Mining Effluent Regulations (MDMER) – The MDMER, created under the *Fisheries Act*, authorizes the deposit of effluent containing deleterious substances prescribed in the regulations provided certain conditions are met. Effluent must meet concentration-based limits for specific substances, have a pH that is between a minimum and maximum level, and must not be acutely lethal. The MDMER sets out the maximum allowable limits for specific metals and other parameter concentrations in discharge resulting from the Project. The MDMER also sets forth a variety of effluent monitoring requirements, as well as the Environmental Effects Monitoring (EEM) criteria to be implemented and reported on during the operational phase of the Project. MDMER limits for new metal and diamond mines (effective June 1, 2021) from Table 1 of Schedule 4 were used in this assessment.

Navigation Protection Act

The *Navigation Protection Act* (NPA), administered by Transport Canada, applies to the construction of works that affect the navigability of waters. Approval from the Minister of Transport is required for construction of any structure in, over, under, or through navigable water that would interfere with navigation (e.g., bridge, boom, pipeline, outfall, effluent diffuser, or dam).

2.2 Provincial Requirements

Mining Act

The *Mining Act*, administered by the Ministry of Mines (MINES), relates to prospecting mineral exploration, mine development and rehabilitation in Ontario, in a manner consistent with the recognition and affirmation of existing Aboriginal and treaty rights in section 35 of the *Constitution Act*, 1982, including the duty to consult, and to minimize the impact of these activities on public health and safety and the environment. Approval is required for mine closure plans by MINES pursuant to Ontario Regulation (O.Reg.) 35/24, which include permitting of offline mine dams in the closure plans.

Lakes and Rivers Improvement Act

The *Lakes and Rivers Improvement Act* (LRIA), administered by the Ministry of Natural Resources (MNR), applies to the design, construction, operation, maintenance, and safety of waterbodies and watercourses in Ontario. For the purposes of the LRIA, this includes online dams, channelizations, water crossings, enclosures, and pipeline installations. Approval is required from the Minister of Natural Resources and Forestry for the construction of online dams, culverts, bridges, and channelizations which may alter fish habitat, natural amenities, and riparian owner rights. In cases where the minimum applicability requirements of the LRIA are not met the *Public Lands Act* may be applicable.

Ontario Water Resources Act and Related Regulations

The *Ontario Water Resources Act* (OWRA) is the principal statute governing water quality and quantity in Ontario. It is a general management statute that applies to groundwater and surface water. Administered by the Ministry of the Environment, Conservation and Parks (MECP), the OWRA contains important regulations that protect water resources, including

- Ontario Regulation 387/04: Water Taking and Transfer Regulation (O.Reg. 387/04), which requires a permit for water takings of more than a total of 50,000 L/d (with some exceptions). section 34 of the OWRA requires the proponent to obtain a Permit to Take Water and section 9 of O.Reg. 387/04 requires all permit holders to collect, record, and report data on daily volumes of water withdrawals.
- Section 53 of the OWRA states that subject to section 47.3 of the Environmental Protection Act, no person shall use, operate, establish, alter, extend or replace new or existing sewage works except under and in accordance with an environmental compliance approval. 2010, c. 16, Sched. 7, s. 3 (9).

Conservation Authority Permitting

Ontario Regulation 165/06 empowers the Mattagami Region Conservation Authority to control development (e.g., placement of fill or alteration of a watercourse) within regulated areas (flooding, erosion, dynamic beaches). Construction within a Conservation Authority regulated area may require a permit in accordance with O.Reg. 165/06.

The following are the Project watersheds within Conservation Authority boundary areas:

- Jocko Creek is a part of the Mattagami Region Conservation Authority potentially requiring a conservation authority permit for works within the watershed.
- The West Buskegau River and North Driftwood River watersheds are not managed by conservation authorities.

2.3 Regulatory Guidance and Criteria to Evaluate Surface Water Quality

The primary regulatory guidance and criteria applicable to this report include the following:

- Ontario Provincial Water Quality Objectives (PWQOs) (MOEE 1994b)
- Ontario Ministry of the Environment and Energy (MOEE). Policy B-1-5 (MOEE 1994a)
- Canadian Council of Ministers of the Environment's Canadian Water Quality Guidelines for Protection of Freshwater Aquatic Life (CCME CWQG-FAL) (CCME 2024)
- Schedule 4 of Metal and Diamond Mining Effluent Regulations (MDMER) SOR/2002-222 under the *Fisheries Act*
- British Columbia Ministry of Environment and Climate Change Strategy (BC MECCS) for the protection of aquatic life guideline for sulphate

The MECP will require an Industrial Environmental Compliance Approval (ECA) for the operation of the industrial sewage works (water management infrastructure) at the site. The PWQOs (MOEE 1994b) are used to evaluate surface water quality with respect to discharges at a site and requires effluent receiving water assessments to follow its Policy B-1-5 (MOEE 1994a).

CCME CWQG-FALs are objectives and guidelines that identify baseline water quality thresholds for this Project site (CCME 2024). The MDMER Schedule 4 Table 1 sets out effluent limits for a number of parameters. The CCME CWQG-FAL provides water quality guidelines are used to assess baseline water quality. The BC MECCS for the protection of aquatic life also provides water quality guidelines are used to evaluate sulphate concentrations.

The CCME CWQG-FALs, PWQOs and BC MECCS used to evaluate baseline water quality are listed in Table 2.1. When values differ, the lowest guideline value is applied to identify exceedances. For narrative or table guideline values, guideline values are calculated using required site-specific parameter input values. For PWQOs with a standard Table 2 PWQO and an Interim PWQO (arsenic, cadmium, lead, zinc), the interim PWQO is used to identify exceedances. Un-ionized ammonia is calculated and assessed by comparing calculated concentrations to the CCME CWQG-FAL and PWQO of 0.016 mg as N/L and 0.0165 mg as N/L, respectively.

Table 2.1 Surface Water Quality Guidelines

Parameter		Units	Reportable Detection Limit (RDL)	CCME CWQG-FAL Guidelines		Provincial Water Quality Objectives
				Short-term	Long-term	
Field pH		-	0	-	6.5 – 9	6.5 – 8.5

Notes:

NA - not applicable, T – total, D - dissolved

a Ni equation: Hardness ≤60 mg calcium carbonate (CaCO3)·L-1, CWQG-FAL is 0.025 mg/L, Hardness >60 to ≤180 mg CaCO3·L-1 use equation $e^{\{0.76[\ln(\text{hardness})]+1.06\}}$, Hardness >180 mg CaCO3·L-1, CWQG-FAL is 0.15 mg/L

b Zn (dissolved) equation: short-term = exp(0.833[ln(hardness mg·L-1)] + 0.240[ln(DOC mg·L-1)] + 0.526 for hardness 13.8 and 250.5 mg CaCO3·L−1 & DOC 0.3 and 17.3 mg·L−1, long-term = exp(0.947[ln(hardness mg·L-1)] - 0.815[pH] + 0.398[ln(DOC mg·L-1)] + 4.625) for hardness 23.4 and 399 mg CaCO3·L−1, pH 6.5 and 8.13 and DOC 0.3 to 22.9 mg·L−1

c TSS narrative “clear flow: Maximum increase of 25 mg/L from background levels for any short-term exposure (e.g., 24-h period). Maximum average increase of 5 mg/L from background levels for longer term exposures (e.g., inputs lasting between 24 h and 30 d).”

d Total Ammonia as N table is temperature and pH dependent. Measurements of total ammonia in the aquatic environment are often expressed as mg/L total ammonia-N. The present guideline values (mg/L NH3) can be converted to mg/L total ammonia-N by multiplying the corresponding guideline value by 0.8224. Consult the CWQG-FAL factsheet for specific table.

e Al CWQG = 5 µg/L if pH <6.5, 100 µg/L if pH ≥6.5

Parameter	Units	Reportable Detection Limit (RDL)	CCME CWQG-FAL Guidelines		Provincial Water Quality Objectives
			Short-term	Long-term	
[f] Cd short-term: 0.11 µg/L if hardness 0 to <5.3 mg CaCO3·L-1, $10^{\{1.016(\log[\text{hardness}]) - 1.71\}}$ if hardness ≥5.3 mg CaCO3·L-1 to ≤360 mg CaCO3·L-1, 7.7 µg/L if hardness >360 mg CaCO3·L-1					
g	Cd long-term: 0.04 µg/L if hardness 0 to <17 mg CaCO3·L-1, $10^{\{0.83(\log[\text{hardness}]) - 2.46\}}$ if hardness ≥17 to ≤280 mg CaCO3·L-1, 0.37 µg/L if hardness >280 mg CaCO3·L-1				
h	Chromium, trivalent (Cr(III)) = 8.9 µg/L; Chromium, hexavalent (Cr(VI)) = 1 ug/L; Chromium, total = no guideline				
i	Mn (dissolved) short-term: benchmark calculator in Appendix B of Scientific Criteria Document for the Development of the Canadian Water Quality Guidelines for the Protection of Aquatic Life: Manganese				
j	Mn (dissolved) long-term: CWQG calculator in Appendix B of the Scientific Criteria Document for the Development of the Canadian Water Quality Guidelines for the Protection of Aquatic Life: Manganese.				
k	TP narrative = Trigger Ranges for Total Phosphorus (mg/L) (see Guidance Framework for Phosphorus factsheet): ultra-oligotrophic <0.004, oligotrophic 0.004-0.01, mesotrophic 0.01-0.02, meso-eutrophic 0.02-0.035, eutrophic 0.035-0.1, hyper-eutrophic >0.1.				
l	DO Narrative = Lowest acceptable DO concentrations for the protection of freshwater organisms; 6 mg/L or greater for early life stages of warmwater species, 5.5 mg/L or greater for other life stages of warmwater species, 9.5 mg/L or greater for early life stages of coldwater species, and 6.5 mg/L or greater for other life stages of coldwater species				
m	Sulphate guideline value is from British Columbia Ministry of Environment and Climate Change Strategy for the protection of aquatic life (Guideline: 128 mg/L for hardness 0 to 30 mg CaCO3·L-1; 218 mg/L for hardness 31 to 75 mg CaCO3·L-1, 309 mg/L for hardness 76 to 180 mg CaCO3·L-1, 429 mg/L for hardness 181 to 250 mg CaCO3·L-1) (Meays and Nordin 2013)				
n	Cu long-term: 2 µg/L if hardness 0 to <82 mg CaCO3·L-1, $0.2*e^{\{0.8545[\ln(\text{hardness})]-1.465\}}$ if hardness ≥82 to ≤180 mg CaCO3·L-1, 4 µg/L if hardness >180 mg CaCO3·L-1				
o	Pb long-term: 1 µg/L if hardness 0 to <60 mg CaCO3·L-1, $e^{\{1.273[\ln(\text{hardness})]-4.705\}}$ if hardness ≥60 to ≤180 mg CaCO3·L-1, 7 µg/L if hardness >180 mg CaCO3·L-1				
p	At pH 4.5 to 5.5 the Interim PWQO is 15 µg/L based on inorganic monomeric aluminum measured in clay-free samples, at pH >5.5 to 6.5, no condition should be permitted which would increase the acid soluble inorganic aluminum concentration in clay-free samples to more than 10% above natural background concentrations for waters representative of that geological area of the Province that are unaffected by man-made inputs and at pH >6.5 to 9.0, the Interim PWQO is 75 µg/L based on total aluminum measured in clay-free samples				
r	Beryllium: 0.011 mg/L if hardness is <75 mg CaCO3 L^{-1}, 1.1 mg/L if hardness >75 mg CaCO3 L^{-1}				
s	Cadmium: 0.0001 mg/L if hardness is 0 to 100 mg CaCO3 L^{-1}, 0.0005 if hardness is >100 mg CaCO3 L^{-1}				
t	Copper: 0.001 mg/L if hardness is 0 to 20 mg CaCO3 L^{-1}, 0.005 mg/L if hardness is .20 mg CaCO3 L^{-1}				
u	Dissolved oxygen: Consult PWQO table depending on cold water or warm water fish species present https://www.ontario.ca/page/water-management-policies-guidelines-provincial-water-quality-objectives				
v	Lead: 0.001 mg/L if hardness is <30 mg CaCO3 L^{-1}, 0.003 mg/L if hardness is 30 to 80 mg CaCO3 L^{-1}, 0.005 mg/L if hardness is > 80 mg CaCO3 L^{-1}				
w	Phosphorus, total (TP): To avoid nuisance concentrations of algae in lakes, average TP concentrations for the ice-free period should not exceed 0.02 mg/L, A high level of protection against aesthetic deterioration will be provided by a TP concentration for the ice-free period of 0.01 mg/L or less. This should apply to all lakes naturally below this value, and excessive plant growth in rivers and streams should be eliminated at a TP concentration below 0.03 mg/L				

3 Study Area

For the purpose of this assessment, the spatial boundaries considered include the direct and indirect effects related to site preparation, construction, operations, and decommissioning and closure of the Project.

3.1 Project Area

The **Project Area (PA)** encompasses the Project footprint and is the anticipated area of physical disturbance associated with the construction, operations, and decommissioning and closure of the Project. The PA is shown on Figure A.2, Appendix A.

3.2 Local Study Area

The **Local Study Area (LSA)** encompasses the area in which Project-related effects (direct or indirect) were predicted or measured with a level of confidence appropriate for the assessment and in which there is a reasonable expectation that the potential effects in the LSA are of public interest.

The LSA includes the PA and includes subwatersheds on the west side of the West Buskegau River main channel, several catchments within the Jocko Creek watershed and headwater subwatersheds of the North Driftwood River. The LSA continues downstream on the West Buskegau River and North Driftwood River, away from the PA. The LSA is shown on Figure A-2, Appendix A.

3.3 Regional Study Area

The **Regional Study Area (RSA)** includes the area within which cumulative effects on surface water quality and quantity are likely to occur, depending on the location of other past, present or reasonably foreseeable future projects or activities.

The RSA for the Surface Water Resources assessment includes the PA and LSA and extends further downstream than the LSA along the North Driftwood River, West Buskegau River and Jocko Creek. The RSA is shown on Figure A-2, Appendix A.

4 Methodology

4.1 Desktop Review and Data Sources

4.1.1 Physiographic Assessment

Understanding the surface features of the PA, LSA, and RSA watersheds is a vital piece of a baseline assessment as the local physiography has an influence on both the quantity and quality of runoff in each affected watershed. Knowledge of the physiographic characteristics of the Project study watersheds is established through a review of surface features, soils and surficial geology information, topography and vegetation typical of the area from publicly available resources.

Vegetation communities and land cover classes are an important consideration in determining expected runoff resulting from rainfall in each relevant watershed. These are identified using available public information maintained by the Government of Ontario. Vegetation and land cover classes within the Project study watersheds are determined based on available geographic information system (GIS) and public source information, which include the Ontario Watershed information Tool (OWIT), and the Ontario Land Cover Compilation (MNRF 2023a; MNRF 2023c).

The topography of the PA is determined using client-provided light detection and ranging (LiDAR) digital elevation images collected in 2021 and 2022 and supplemented with provincially available topographic contour mapping (MNRF 2023b). Topography, geological, and soils mapping, such as the Soil Survey Complex published by the Ontario Ministry of Agriculture, Food, and Rural Affairs (OMAFRA) are also reviewed to establish the expected surficial geology (OMAFRA 2023).

The approach for identifying site physiography, topography, vegetation and soils data is in alignment with related baseline reporting. Additional baseline reports may be reviewed to provide additional details on location physiography (Appendix B.1 of the Impact Statement [Soils and Terrain Baseline Report], Vegetation, Riparian and Wetland Environments Supplemental Baseline Report (Appendix B.7.1 of the Impact Statement) and Terrestrial Wildlife and Wildlife Habitat Supplemental Baseline Report (Appendix B.7.3 of the Impact Statement)).

4.1.1.1 Climate and Climate Change

Climatic factors have a defining influence on the hydrologic conditions of the Project study watersheds. Temperature and precipitation directly influence the quantity and timing of expected runoff, evapotranspiration rates, and infiltration rates. It is important to characterize the climatic conditions of the site, especially as they are anticipated to change over time.

The climatic setting of the Project is established through assessment of available climate data, including temperature and precipitation data, and applicable intensity-duration-frequency (IDF) curves.

Stations located up to 100 km away from the site, with greater than 10 years of record, and with more recent climatic data (2000s onwards) are considered for use as climate data sources. At the time of this work being performed, ECCC announced upcoming updated climate normal information for the period of 1991-2020 but had not yet released updated climate normals for stations found near the project site. Thus, climate data taken from ECCC climatological monitoring stations is analyzed following ECCC's methodology to determine the climate normal for the 1991-2020 period, maximum, minimum, wet year, and dry year climatic conditions are calculated (ECCC 2020).

ECCC follows the World Meteorological organization's (WMO) guidelines for determining climate normals. The same methodology is applied in this case to determine the updated climate normals relevant to the PA (ECCC 2020; WMO 1989). ECCC describes the methodology used to determine 30-year climate normals within *Canadian Climate Normals 1991-2020 Calculation Information* (ECCC 2020). Within the document, ECCC described the application of the WMO "3 and 5 rule" where a month included in the climate normal calculations must not have more than three consecutive missing values for temperature or other parameters being assessed, and no more than five missing values total within the month. Applying the "3 and 5 rule", mean averages of temperature and precipitation on a monthly scale are taken to determine the climate normal values.

A wet and dry year assessment was performed using available data at the project site. Dry years are defined as years having annual precipitation less than climate normal precipitation amounts and wet years are defined as years having annual precipitation greater than the annual climate normal precipitation.

Precipitation data for storm events with durations ranging from 5-min to 24-hours are calculated from available IDF curves at the climatological monitoring stations. IDF curves summarize the annual exceedance probability of a depth of rainfall in a single event of selected duration and intensity. ECCC periodically publishes IDF curves at selected meteorological locations in Ontario and elsewhere in Canada (2023c).

The 24-hour storm events rainfall data of various return periods (i.e., 2, 5, 10, 25, 50, and 100 year) are representative for conservative use in conjunction with other hydrology information to assist with the sizing of infrastructure, such as sediment ponds, culverts across access roads and diversion channels. To calculate the precipitation for these return periods of both wet and dry year conditions, hydrological frequency analysis (HYFRAN) software is used (El Adlouni and Bobée 2015).

Annual and monthly snow depth and snowfall data is summarized based on available data from ECCC climate stations relevant to the project site. Barometric pressure data is collected on site as a part of the hydrometric study field program, further described in Section 4.2.1.

Quantitative predicted impacts from climate change on temperature and precipitation are necessary to estimate potential peak flow and runoff volume changes into the future and assist with water management infrastructure design for the Project to consider climate change adaptation. Future predictions of impacts to site specific IDF curves, temperature and precipitation impacts are collected from the climate change scenario model results provided by ClimateData.ca (2024). ClimateData.ca is a collaboration between

ECCC, the Computer Research Institute of Montréal, Ouranos, the Pacific Climate Impacts Consortium, the Prairie Climate Centre, and HabitatSeven to provide access to climate change data (ClimateData.ca 2024).

The Intergovernmental Panel on Climate Change (IPCC) advises the use of ensemble models to make future predictions on the impacts of climate change since these models tend to be more successful than individual models for both seasonal and long-term simulations (IPCC 2007; Boer and Lambert 2008). This is because ensemble models work by developing a mean prediction based on the outputs from several different models, which helps to then reduce model uncertainty. The model used to provide data for the Project study area comes from the global Coupled-Model Intercomparison project (CMIP). The CMIP6 ensemble model is used to provide climate change estimates for the Project study area as it is the most recent model available at ClimateData.ca (2024). CMPI6 represents various emission scenarios as Shared-Socioeconomic Pathways (SSPs), otherwise referred to as Representative Concentration Pathways (RCPs). IPCC's most recent technical reporting refers to each scenario as SSPx-y, where "SSPx" refers to the SSP describing the socio-economic trends underlying the scenario, and "y" refers to the approximate target level of radiative forcing (in W/m^2) resulting from the scenario in the year 2100 (Arias et. al. 2021).

To provide a comprehensive picture of future conditions at the site, three SSP scenarios are considered. These three scenarios include the low emission scenario (SSP1-2.6), moderate emission scenario (SSP2-4.5), and a high emission scenario (SSP5-8.5). The Canadian Standards Association (CSA) Plus 4013:19 technical guide recommends that moderate to high emission scenarios are used for Project projections (CSA 2019). Model results are available in 30-year time frames, and the IDF curves and total precipitation monthly and annual amounts are predicted over a time frame of 2071-2100 are assessed to capture the Project timescale covering 41 years of active mine period, 5 years of active closure, and the post-closure period. The snowfall variable is estimated using the auer snowfall approximation with a threshold of 0°C and the rainfall is then calculated by subtracting snowfall from the total precipitation variable.

4.1.1.2 Watershed Delineation

The Project study area is located within three main watersheds: North Driftwood River Watershed, West Buskegau River Watershed, and Jocko Creek Watershed (Figure A.3, Appendix A). Watershed boundaries for the three study watersheds are estimated in tandem with a Project site LiDAR sourced digital elevation model (DEM) and Provincial Ontario sourced DEM. The provincial DEM has a spatial resolution of 30 m (OMAFRA 2023), whereas the LiDAR mapping has a resolution of 1 m. To avoid edge effect, the two maps are not merged together, but instead the LiDAR mapping, due to its higher spatial resolution, is used initially for watershed delineation. Gaps in the available LiDAR DEM coverage of the watersheds are filled using data from the Ontario Provincial DEM (MNRF 2023b). Where watersheds extend across both datasets, the watersheds are stitched together using elevation trends and aerial imagery to align the drainage areas.

The three watersheds (North Driftwood River, West Buskegau River and Jocko Creek) are divided further into subwatersheds, based on the following:

- Junctions of tributaries into equal or higher order channels following the Strahler Stream order method
- Location of potential project infrastructure (e.g., treatment plant outfalls, diversion channel inflow and discharge points)
- Hydrometric monitoring stations

4.1.2 Regional Hydrology Assessment

Regional streamflow monitoring stations operated by the Water Survey of Canada (WSC) were assessed to characterize the regional hydrology. This assessment examines hydrology data at a regional scale, allowing for many years of flow data from WSC hydrometric stations to be analyzed allowing extreme and mean (high, low and mean) flow events to be captured. This provides greater confidence in flow statistics that are generated to represent the hydrologic conditions of the Project study watersheds. The site hydrology data collected at the Project study watersheds can then be used to assess suitability with the regional hydrology relationships.

The WSC stations are first assessed using a series of selection criteria before assuming homogeneity between sites. These criteria include catchment area, station location, period of record, and others that are described in further detail in this section. Transpositional scaling assumes homogeneity will be more likely due to their proximity, similar climate and physiographic conditions between the selected regional WSC stations.

The accuracy of peak-flow frequency estimates studied by Dalrymple and Benson (1960) determined the years of records needed for peak flow frequency estimates and the results were summarized by the United States Geological Survey (USGS) (2003). A summary of minimum stream flow record length and associated return periods is presented in Table 4.1.

Table 4.1 Recommended Minimum Stream Flow Record Lengths for Return Period Estimates (USGS 2003)

Return Period	Minimum Record Length (Years)
10 Year	8
25 Year	10
50 Year	15
100 Year	20

The following criteria are used for WSC station selection for the regional hydrology assessment:

1. WSC station watershed has an area approximately no greater than one order of magnitude difference to the largest Project study area watershed, which would be the West Buskegau watershed.
2. The station is located less than 200 km from the Project Site to maintain climatic and physiographic comparability with local watersheds.
3. The station has a period of record that falls within one climate normal period - preferably the most recent ECCC climate normal period currently being estimated for climate stations in Canada (1991 to 2020) (ECCC 2023b).
4. The station has a natural flow regime (non-regulated) as Project site watersheds are natural.
5. The station has a period of record greater than 20 years to support development of long-term hydrological statistics for average, low and high flows, and estimation of 100-year event flows. Stations with period of record of greater than 15 years are included in the assessment as they typically represent smaller watersheds in the region that are closer in size to the Project watersheds.

Based on the above criteria, eight selected WSC hydrometric stations are included the regional hydrological assessment to further undergo homogeneity testing (Table 4.2).

Table 4.2 Regional WSC Stations Selected for the Regional Hydrology Homogeneity Assessment

Station ID	Station Name	Drainage Area (km^2)	Years of Record	Record Period	Site Proximity (km)	Climate Normal[1] Prec. (mm)
02JC008	BLANCHE RIVER ABOVE ENGLEHART	1780	56	1968-2023	150 km SE	811
04LC003	IVANHOE RIVER AT FOLEYET	1640	20	2002-2023	100 km SW	844
04LK001	MATTAWISHKWIA RIVER AT HEARST	1170	26	1985-1993; 2006-2023	190 km NW	768
04LB002	KAMISKOTIA RIVER ABOVE ENID CREEK	926	16	2009-2023	25 km SW	836
04LA003	TATACHIKAPIKA RIVER NEAR TIMMINS	872	23	2001-2023	52 km S	830
04LE002	NEMEGOSENDA RIVER NEAR CHAPLEAU	432	18	2006-2023	150 km SW	869

Station ID	Station Name	Drainage Area (km^2)	Years of Record	Record Period	Site Proximity (km)	Climate Normal[1] Prec. (mm)
04MD004	PORCUPINE RIVER AT HOYLE	408	34	1977-1994; 2007-2022	37 km SE	836
04LA006	MOLLIE RIVER AT HIGHWAY NO. 144	92.5	17	2007-2023	150 km S	828

Note:
1. Annual precipitation data from OWIT (2023)
Source: ECCC 2023d

With the above shortlisted WSC stations, further assessment is applied to confirm hydrologic homogeneity where the landscape is subject to similar climate, and physiographic conditions. Validated stations for homogeneity can then be used to apply the regional regression method, in which regression equations are developed for relationships between variables of interest and catchment area. These regression equations can then be used to characterize the local hydrologic conditions using the local watershed drainage areas.

Validation for the regional hydrology dataset is conducted by a number of tests to verify the hydrologic homogeneity of the group of stations. A station would not be eliminated because it failed a single test but would be eliminated if it failed multiple tests demonstrating more heterogeneity than homogeneity. The tests used to confirm hydrologic homogeneity include:

- Mean Slope: The mean slopes of the watersheds associated with each of the WSC stations are obtained from OWIT (MNRF 2023). OWIT is an online spatially based application generating watershed areas and statistics of a watercourse at a location of interest within Ontario.
- Percent Area of Waterbodies: The percent area of the WSC station watersheds that are dominated by waterbodies are obtained for each WSC station from OWIT.
- Average Annual Precipitation: Precipitation for each WSC station is obtained from OWIT to assess which stations meet the threshold for average annual precipitation homogeneity of +/-10% in comparison to the local value, defined by ECCC station climate normals.
- Unit Flow: Unit flows are calculated for each WSC station by dividing the mean annual flow by the associated catchment area to provide a unit of flow per square kilometre of catchment area.
- Flow Duration Curve (FDC): a flow duration curve is an analytical tool used to study the variability of stream flows. The flow duration curve presents the ratio of the daily flow divided by the mean annual flow versus the exceedance probability of that ratio.
  - FDCs are used in determination of water supply capacity, water quality management, river sedimentation, flood control and environmental flow requirements. FDCs are derived using daily discharge records obtained for the selected WSC stations. For each station, daily discharge for the period of record is ranked largest to smallest value, and exceedance probability P is calculated for the records using Equation 4-1:

$$P = 100 * [\frac{M}{n+1}] \qquad \textbf{Equation 4-1}$$

Where: *P* = the probability that a given flow will be equaled or exceeded (% of time);
M = the ranked position on the listing (dimensionless);
n = the number of events for period of record (dimensionless)

- Index Flood Flow: The index flood flow is a technique used in flood studies to assess the homogeneity of WSC stations based on the return interval of the regionally based 10-year flood flow and the station period of record. Moin and Shaw (1985; 1986) had developed index flood flows for Ontario streams. The method below follows the technique used by Dalrymple (1960) and Harvey et al. (1985) with the homogeneity test using an Extreme Value Type 1 (EV1) distribution by Gumbel (1958).
  - The regionally based 10-year flood flow is calculated by dividing each station's 10-year flood flow by the index flood flow (2.33-year return period flood flow or the mean annual flood flow), which is averaged over the data set. The mean annual flood flow is multiplied by the averaged unitless 10-year flood flow divided by the mean annual flood flow to yield the regionally based 10-year flood flow.
  - A flood frequency curve is plotted for the regionally based 10-year flood flow to develop a relationship between the flood flow and return period for each station. A station-based return period is then calculated for each station to plot against the station period of record and compared to the upper and lower limit curves.

Once the above-described homogeneity tests have been applied to the stations listed in Table 4.2, the stations selected to represent regional hydrology will be confirmed. With this, the regional assessment proceeds with the following analysis steps for development of relationships that can be applied to the local area.

- Mean annual and monthly flows – using daily flow data, annual mean relationships and monthly mean flow relationships are generated using regression. These relationships are then applied to watersheds in the LSA. The mean annual flow (MAF) is calculated by determining the mean flow for each year, then averaging the values for the full record of the dataset. Mean monthly flows (MMFs) are calculated similar to the MAF, but performed for each month rather than each year, and then by averaging the values for the full record of the station dataset.
- Peak flow frequency analysis – using instantaneous peak flow data for the selected WSC hydrometric stations, regression relationships are developed. The regression relationships can be used for estimations of peak flows for watershed areas within the Project site to assist the design of Project infrastructure.
  - Peak flows are calculated using the instantaneous flows from the regional WSC stations. The instantaneous peak flow for each year is input into HYFRAN software (EI Adlouni and Bobée 2015) to calculate the peak flow for various return periods (2, 5, 10, 25, 50, and 100 year). A Log-Pearson Type III distribution with Method of Moments is used to calculate the peak flows.

Peak flow and environmental low flow estimates are typically used as the design flow for project infrastructure.

- Environmental flows (maintenance flows, instream flow needs) describe the quantity, timing and quality of water flows required to sustain freshwater and estuarine ecosystems. Through implementation of environmental flows, a flow regime that maintains the essential processes to support healthy river ecosystems can be achieved (eFlowNet 2007). The most widely used hydrological methods to estimate the low flow indices, include:
  - single low flow indices (e.g., $7Q_{10}$, $7Q_{20}$) – Single low flow indices are derived using a regional frequency analysis for the selected WSC stations.
  - the Tennant Method (1976) and its modification, the Tessman Method (1980) – The Tessman method is an extension of the Tennant method (Tessman 1980), which is based on a combination of MMF and MAF. It assumes that flows that are satisfactory for needs of fish and other aquatic biota will also be satisfactory for maintaining recreational and aesthetic quality. Environmental flow is a screening criterion, specific flow requirements would be confirmed based on site specific aquatic habitat and fisheries requirements. The Tessman method recommends minimum monthly flow guidelines which are presented in Table 4.3.

Table 4.3 Tessman Rules (Tessman 1980)

Recommended Minimum Flow	Criteria
Mean Monthly Flow (MMF)	If MMF < 40% Mean Annual Flow (MAF)
40% of MAF	If MMF>40% MAF and 40% MMF <40% MAF
40% MMF	If 40% MMF >40% MAF

  - In 2013, DFO published a report titled the *Framework for Assessing the Ecological flow Requirements to Support Fisheries in Canada* which provided guidance on the application of a ±10% threshold limit to changes of instantaneous flow relative to the natural flow regime. Additionally, a second limit is applied for when instantaneous flow values fall to below 30% of the Mean Annual Discharge (MAD; or MAF). To make this comparison for potential future impacts associated with the Project in local receiving waters, 30% MAF values are determined at each of the Project watersheds.
- Baseflow Index (BFI) – The BFI is defined as a ratio between baseflow volume and total streamflow volume. The BFI is calculated using SepHydro, a hydrograph separation tool developed by the Canadian Rivers Institute (CRI), University of New Brunswick (UNB) and Agricultural and Agri-Food Canada (AAFC) (Danielescu 2018). Using daily flow data from the WSC stations as an input, SepHydro is used to estimate the percent of baseflow contribution for each of the stations to provide a regional estimate for BFI. SepHydro separates baseflow from streamflow using a variety of available methods. The method applied for this study is the Lynne and Hollick method (1979). The SepHydro interface allows for the application of numerous baseflow separation methods. The Lynne and Hollick method is selected by comparing fit and applicability of other methods to the station flows. Lynne and Hollick applies the following equation to the streamflow time series:

$$q_t = \alpha q_{t-1} + \frac{(1+\alpha)}{2}(Q_t - Q_{t-1})$$ **Equation 4-2**

Where: q = surface or quick runoff (m^3/s);
Q = the streamflow (m^3/s);
t = time step;
α = the catchment constant (between 0 and 1)

4.1.3 Environmental Water Balance

To support understanding of the baseline hydrologic system at the Project site, an accounting procedure is applied to assess the amounts of water transferring to various elements of the hydrologic system (e.g., evapotranspiration, infiltration, streamflow). This is referred to as an environmental water balance, which can be represented by the following relationship:

$$P = ET + R + I \pm \Delta S$$ **Equation 4-3**

Where: P = Precipitation;
ET = Evapotranspiration;
R = Overland Flow or Surface Runoff;
I = Infiltration (Surplus); and
ΔS = Change in Storage

A monthly water balance model based on the Thornthwaite equation (Thornthwaite and Mather 1957; McCabe and Wolock 1999) with a graphical user interface developed by the USGS is used to estimate Project site evapotranspiration, surface runoff and streamflow (USGS 2007). The model requires inputs of monthly precipitation, average monthly temperature, runoff factor, soil moisture storage capacity and snow and rainfall temperature thresholds.

The potential evapotranspiration (PET) in the model is calculated using the Hamon equation (Hamon 1961):

$$PET_{Hamon} = 13.97 \times d \times D^2 \times W_t$$ **Equation 4-4**

Where: PET_{Hamon} = Monthly potential evapotranspiration in millimeters;
d = number of days in a month;
D = mean monthly hours of daylight in units of 12 hours; and
W = saturated water vapor density term, in grams per cubic meter.

The saturated water vapor density term is calculated by the following equation:

$$W_t = \frac{4.95 \times e^{0.062 \times T}}{100}$$ **Equation 4-5**

Where: T = mean monthly temperature in degree Celsius (Hamon 1961)

Actual evapotranspiration (AET) is derived from PET and soil-moisture. When precipitation for a month is less than PET, the AET is equal to precipitation plus the amount of moisture that can be withdrawn from storage in the soil. If precipitation for a month is greater than PET, then AET equals PET.

PET represents maximum possible evaporation which traditionally is calculated as evaporation from a lake surface in similar climate conditions. ECCC has a limited number of stations where pan evaporation is monitored, and lake evaporation rates are estimated.

Water surplus is defined using the infiltration factor as defined by the Ontario Minister of Environment Conservation and Parks (MECP), formerly the Ministry of the Environment (MOE) (MOE 2003). The infiltration factor is determined from average topographic slope, hydrologic soil type, and vegetation cover type. Infiltrated water recharges aquifers and routes via interflow to streams and lakes. Net infiltrated water recharges aquifers and discharges as baseflow locally or regionally. For this study, ground watersheds are assumed to align with surface watersheds and all baseflow returns to a local watershed where infiltration occurred.

Additionally, for the purpose of the water balance calculations, it is assumed that runoff, evapotranspiration, and infiltration are negligible in months with average monthly temperatures below 0°C.

The water balance model is applied to climate normal, wet, and dry year conditions to estimate the baseline environmental water balance over a temporal scale compatible with the Life of Mine (LOM), which is expected to operate for 41 years. A warmup period of 2 year of climate normal data is applied, then followed by either the wet year, dry year, or climate normal for the third year. Results are taken from the third year for discussion.

4.1.4 Hydrological Model

4.1.4.1 Model Selections

The US Army Corps of Engineers' (USACE) Hydrologic Engineering Centre Hydrologic Modelling System (HEC-HMS) software is selected for use for the development of the baseline hydrological model. HEC-HMS has been widely used for watershed studies, subwatershed studies, hydrological statistics and simulations, site plans, and flood risk management for projects in Ontario. Version 4.10 is used for the development of this model.

4.1.4.2 Model Setup

4.1.4.2.1 Watershed Delineation

Watershed delineation is an important step in developing any hydrologic model. An accurate watershed delineation and discretization is required to generate accurate flows. A separate HEC-HMS model was generated for each of the three following watersheds: Jocko Creek, North Driftwood River, and West Buskegau River to improve system stability while performing runoff simulation runs. The subwatersheds used in the model are the same as described in Section 4.1.1.2. Figure A-3, Appendix A presents watershed and subwatershed delineation, with watershed characteristics tables provided in Appendix B.1.

Figure 4.1 to Figure 4.3 provide a visual schematic of each watershed's HEC-HMS modelling components and linkages.

Figure 4.1 Jocko Creek Watershed Model

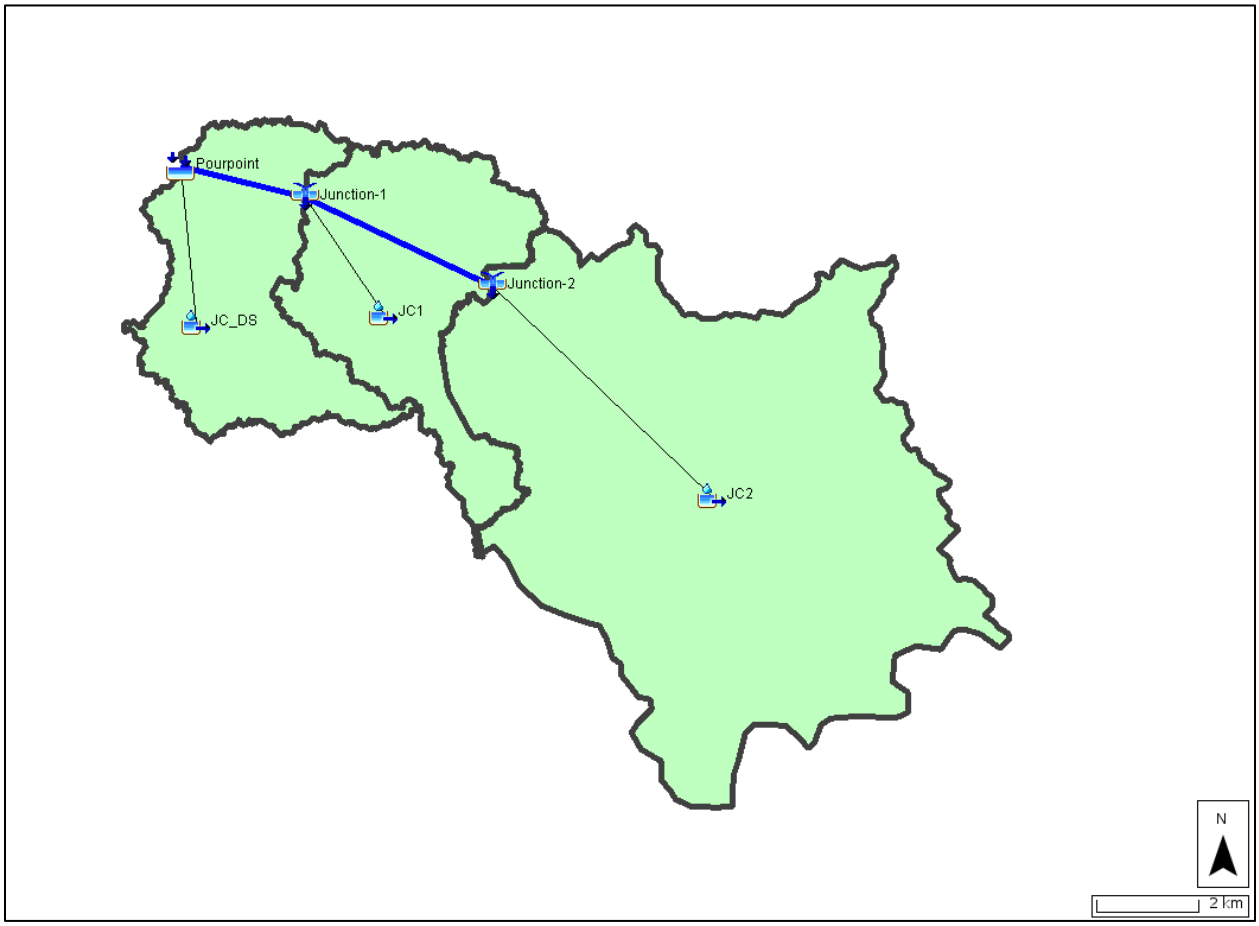

Figure 4.2 North Driftwood Watershed Model

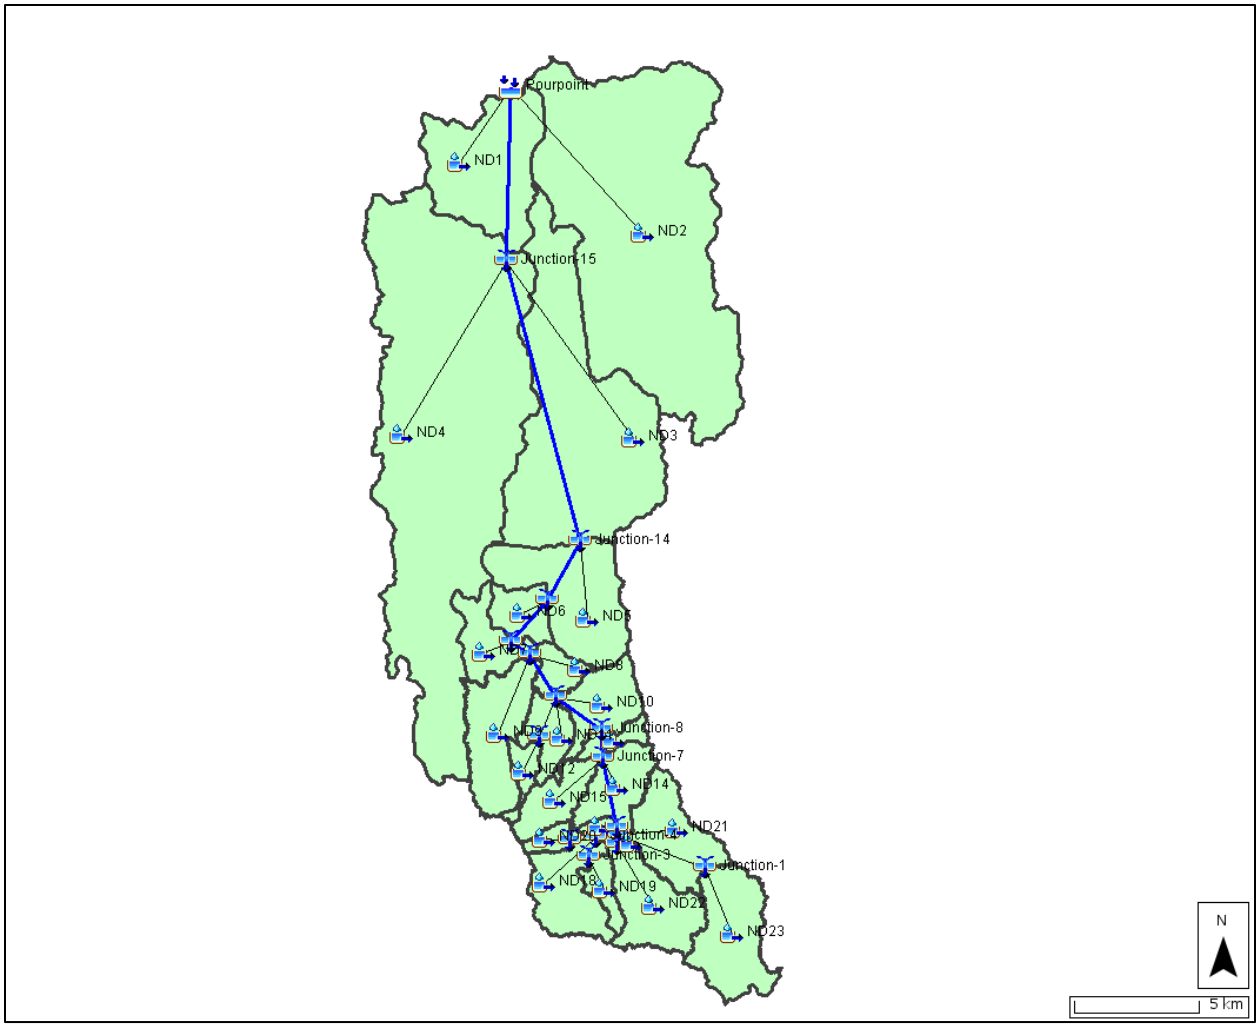

Figure 4.3 West Buskegau Watershed Model

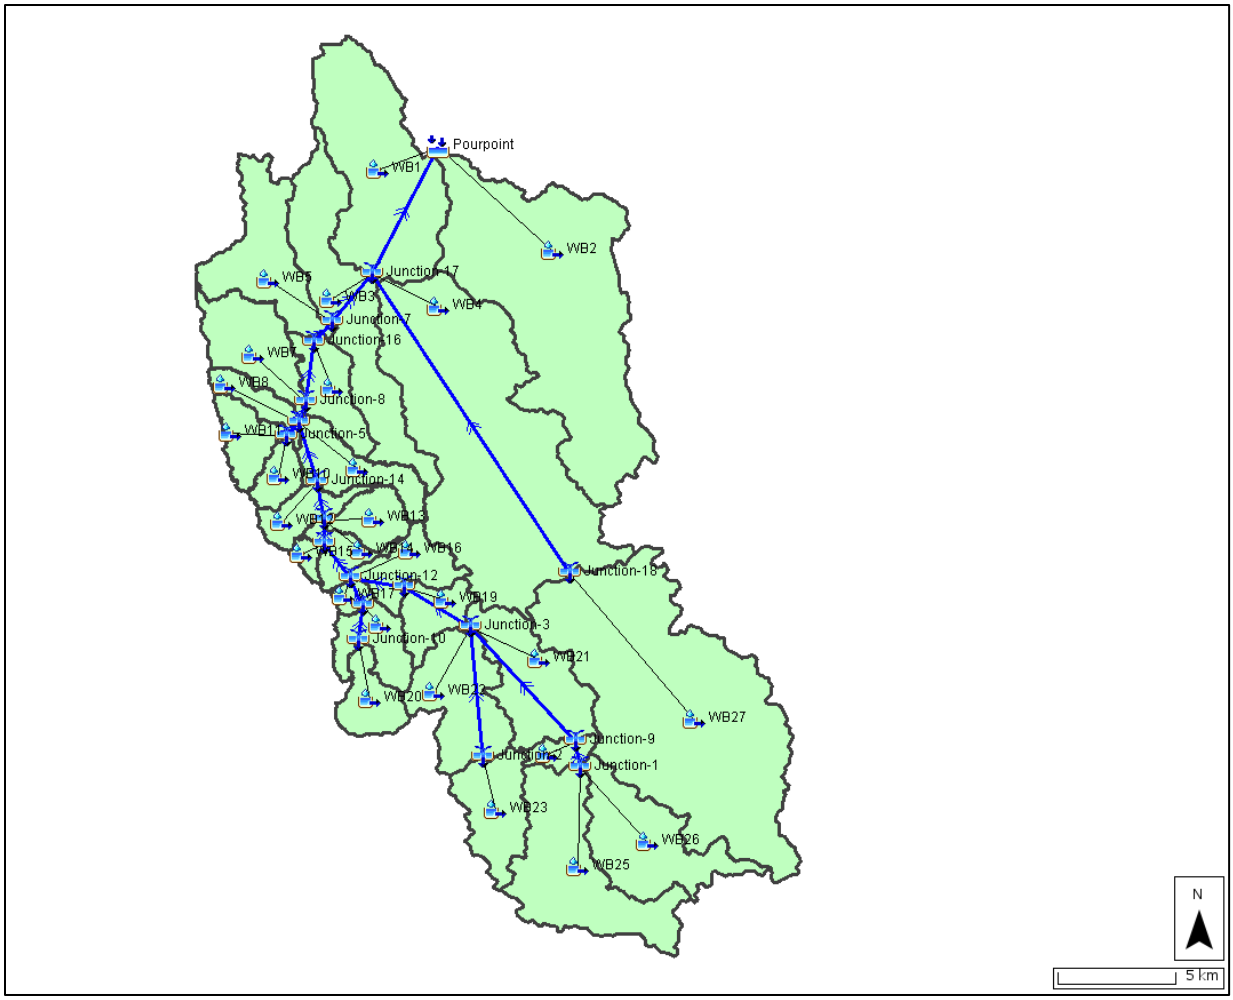

4.1.4.2.2 Land Cover

The Ontario provincial land cover compilation and soils complex data were used to define subwatershed characteristics, such as the hydrologic Curve Number (CN) (MNRF 2023c, OMAFRA 2023). The data presented align with the observations in the Soils and Terrain Baseline Report ((Appendix B.1 of the Impact Statement) . Appendix B.1 of the Impact Statement provides summary tables describing the land cover and hydrologic soil group types of each of the subwatersheds as determined by provincial sources. The Curve Number (CN) for each subwatershed was calculated using the Soil Conservation Service (SCS) Runoff CN method as defined by United States Department of Agriculture (USDA) Technical Release for Urban Hydrology for Small Watersheds (TR-55) (USDA 1986). In following the SCS Runoff approach for CN, TR-55 Table 2-2a provided reference for CN values based on hydrologic soils group and land cover type. The cover type described by TR-55 Table 2-2a were matched to a corresponding land cover type provided by the Ontario Land Cover Compilation (MNRF 2014) to create an equivalency

table between land cover type, Ontario land cover type description, and hydrologic soil-group based curve numbers. Table 4.4 presents the equivalency values used in the determination of CN values.

Table 4.4 TR-55 Table 2.2a CN Values Equivalency Table for Ontario Land Cover Classes

Ontario Land Cover Type	Equivalent Cover Type from TR-55	Description of Equivalency	Curve Number by Soil Group			
			A	B	C	D
Bedrock	Impervious areas	Bedrock is primarily impervious	98	98	98	98
Bog	Brush, Good Condition	Describes areas with brush with > 75% ground cover by brush-weed-grass	30	48	65	73
Clear Open Water	open water	CN is the relationship between runoff and infiltration. If rainfall lands on open water, that is considered as complete runoff.	100	100	100	100
Community / Infrastructure	Impervious areas, streets and roads, paved: open ditches	Aerial imagery shows that infrastructure present is primarily roads and highways.	83	89	92	93
Coniferous Treed	Woods, Good Condition	Describes land that is very densely forested	30	55	70	77
Deciduous Treed	Woods, Good Condition	Describes land that is very densely forested	30	55	70	77
Disturbance	Herbaceous, Fair Condition	Describes herbaceous vegetation with vegetation cover of 30%	60*	71	81	89
Fen	Woods (grass), Poor Condition	Fens are groundwater fed wetlands and the water table is usually quite close to the surface level, limited ability for infiltration, vegetation is <25% forested	57	73	82	86
Mixed Treed	Woods, Good Condition	Describes land that is very densely forested	30	55	70	77
Sparse Treed	Woods, Fair Condition	Sparse Treed land cover type describes forested areas with less dense coverage, bedrock or rapidly draining soils, typically dried conditions (semiarid)	43	65	76	82
Swamp	Woods(grass), Fair Condition	“Swamp” describes open, shrub and treed communities where the water table is seasonally or permanently at, near, or above substrate surface - tree or shrub cover > 25% - dominated by hydrophytic shrub and tree species	43	65	76	82
Turbid Water	open water	CN is the relationship between runoff and infiltration. If rainfall lands on open water, that is considered as complete runoff.	100	100	100	100
Agriculture and Undifferentiated Rural Land Use	Pasture (grassland), Good Condition	Ontario Land Cover describes land as sparse shrubs in rural land, land cleared for agricultural use that may or may not be currently active.	39	61	74	80

Note: * This is an estimated value used for calculations as TR-55 does not provide a value for this cover type and soil condition.

CN is a direct function of the land cover type and the hydrologic soil group type. Since each subwatershed contained soils of multiple hydrologic group types, a weighted average of CN values for each individual subwatershed was used to define the overall CN.

Another input generated based on the topographic delineation of the subwatersheds is the lag time. In following with the TR-55 Manual, the SCS watershed lag method was used to calculate lag time. The calculation for lag time used for each subwatershed is described below.

Lag time is calculated by the following equation:

$$L = \frac{l^{0.8}\,(S+1)^{0.7}}{1900Y^{0.5}} \qquad \textbf{Equation 4-6}$$

Where:

L = Lag time (h)
l = flow length (ft)
Y = averaged watershed land slope (%)
S = maximum potential retention (in)

$$= \frac{1000}{cn'} - 10$$

Where: *cn'* = the retardance factor, equivalent to the CN (USDA 1986)

Appendix B1 provides a summary table for each variable (channel length and average slope). The maximum potential retention is calculated as described above, based on the determined weighted average CN values for each subwatershed. The determined input parameters are provided below in Table 4.5.

Table 4.5 Summary of Subwatershed Land-Use Based Input following USDA TR-55 Methods

Watershed	Subwatershed ID	Area (ha)	Weighted Average CN	Lag Time (min)
Jocko Creek	JC1	1,945	77.1	1,899
	JC2	7,182	77.0	6,212
	JCDS	1,837	77.5	2,553
North Driftwood	ND1	2,148	82.7	2,588
	ND10	771	75.7	1,649
	ND11	478	76.6	1,340
	ND12	242	77.5	1,295
	ND13	233	75.0	1,060
	ND14	719	77.0	1,379
	ND15	580	75.7	1,746
	ND16	107	77.9	780
	ND17	28	78.5	492
	ND18	953	77.9	1,638

Watershed	Subwatershed ID	Area (ha)	Weighted Average CN	Lag Time (min)
	ND19	275	76.1	1,175
	ND2	8,441	81.4	6,581
	ND20	165	73.2	953
	ND21	1,075	77.3	1,975
	ND22	1,066	78.6	1,598
	ND23	1,302	73.0	3,517
	ND3	5,061	77.2	6,539
	ND4	10,217	76.1	8,332

4.1.4.2.3 Unit Hydrograph Selection

HEC-HMS software provides multiple options for unit hydrograph selection such as: Clark unit Hydrograph, Kinematic wave, ModClark, SCS Unit Hydrograph, Snyder Unit Hydrograph, and User-specified hydrograph options. For this model, the SCS unit hydrograph with a peaking factor of 250 was selected.

The SCS Unit Hydrograph method is described in detail within Chapter 16 of the National Engineering Handbook (NEH), created by the USDA Natural Resources Conservation Service (NRCS), as well as the TR-55 (USDA 1986; USDA NRCS 2007). The SCS unit hydrograph is standard, dimensionless representation of runoff resulting from a uniform rainfall depth of 1 inch applied to an entire watershed (USDA NRCS 2007). The unit hydrograph was derived following empirical methods and is a recognized standard of practice for use within the field of hydrology to characterize runoff response within watersheds (USDA NRCS 2007). The peaking factor (or otherwise known as the Peak Rate Factor [PRF]) describes the shape of the unit hydrograph. A higher PRF value leads to a higher peak runoff from the hydrograph. PRF values typically range between 600 and 100 (USDA NRCS 2007). Watersheds that are flatter, and more characterised by swamp or bog land types have lower PRF values. The selected value of 250 is consistent with the topography and physiographic conditions of the site and was determined based on iterative model calibration.

4.1.4.2.4 Channel Routing

Channel routing is required to simulate flood wave travel times and reduction in peak flow as flows propagate downstream along a reach. The HEC-HMS model defines reach components that route hydrographs through typical channel cross-sections using the Muskingham-Cunge routing method. Inputs for this routing method include channel bed and side slope, Manning's roughness coefficient across the main channel width, channel shape, and bed width.

Within HEC-HMS, subwatershed elements were linked with channel routing where the main river channel (either Jocko Creek, the North Driftwood River, or the West Buskegau River channel) of each watershed physically exists. Minor creeks and tributaries are not modelled with channel routing. Thus, channel geometry parameters maintain consistent along every reach of the channel within the subwatershed and not every subwatershed contains a section of the main channel.

Channel length and slope vary between subwatersheds, and were determined from the topographic assessment using LiDAR and the Provincial DEM. Channel bed width and side slope estimation was determined through field observations of channel geometry at the surface water monitoring stations described in Section 4.2.1. Channel geometry has been approximated as trapezoidal for all channels and

reaches. Additionally, HEC-HMS requires a celerity value for each reach. The input celerity of 5 ft/s (1.524 m/s) is standard and applicable in most modelling scenarios (USACE 2024). Table 4.6 summarizes the determined channel input parameters.

Table 4.6 HEC-HMS Channel Routing Model Input Summary

Watershed	Subwatershed ID	Reach Length (m)	Bed Slope (m/m)	Manning's n	Bottom Width (m)	Side Slope (xH:1V)
Jocko Creek	JC2	52,712	0.0180	0.035	8	2
	JCDS	11,250	0.0424	0.035	8	2

4.1.4.2.5 Snowmelt Model Parameters

HEC-HMS models hydrological systems through setting up various subbasin components, linking flows via reaches or junctions, and managing parameters to represent snowmelt, losses, and baseflow within each subbasin.

The Temperature Index method was chosen to process snowmelt conditions (USACE 2024). This method is an extension of the degree-day approach described within Chapter 11 of the NEH (USDA NRCS 2004). The Degree-day approach sets a defined amount of snowmelt to occur for each temperature day above freezing. The temperature index method supplements this approach by representing the impacts of the cold thermal energy stored in the snowpack, along with a limited memory of past conditions, and factors associated with atmospheric conditions on the melt rate (McNanus 2022).

Specific input parameters were chosen based off typical values and through further optimization of the model relative to local flow data. Table 4.7 summarizes the final input parameters into the HEC-HMS model for snowmelt.

Table 4.7 HEC-HMS Snowmelt Method Input Summary

Parameter Name	Description	Unit	Input Value
PX temperature	Temperature below which precipitation is considered as snow	ºC	0
Base Temperature	Base temperature defining freezing point	ºC	0
ATI Coefficient	Antecedent Temperature Index (ATI)	-	0.017
Wet melt rate	Represents the rate at which the snowpack melts when it is raining on the snowpack.	mm/ ºC day	20.450
Rain rate limit	If falling rain rate is greater than the rain rate limit, wet melt rate becomes applicable	mm/day	0.8
Cold Limit	Accounts for the changes in temperature that the snowpack undergoes during high precipitation	mm/day	4.941
Coldrate coefficient	Used to update the antecedent cold content index from one time interval to the next.	-	0.569
Water Capacity	specifies amount of melted water that must accumulate in the snowpack before liquid water becomes available at the soil surface for infiltration or runoff	%	3
ground melt rate	Fixed value to account for snowmelt caused by contact with the ground	mm/day	0

A final input for the temperature index method is the ATI-melt rate function. This dry melt function describes the relationship between melt rate and accumulated number of melt days over time. To determine the ATI-melt rate function, station data including snow depth measurements need to be sourced. In this case, the ECCC Timmins Victor Power Airport Station (6078285) was used.

First, the ATI-degree days is determined by taking the difference between air temperature above freezing temperature (0ºC). This is a cumulative value, so the ATI-degree days is always summed with that of the previous days. Each timestep now has a defined cumulative ATI-degree day value. Melt is determined for each timestep where there was no precipitation and with a positive ATI by taking the difference in measured snow depth with the past timestep. The melt rate of existing snow to the accumulated number of thawing degree days (McNanus 2022) is then the slope of the measured melt over the ATI-degree days. The melt rate function is summarized in the following table (Table 4.8).

Table 4.8 ATI Dry Melt Rate Function Summary Derived from Timmins Climate Station Data (6078262)

ATI (ºC Day)	Melt Rate (mm/ºC Day)
0	0.459
23.6	0.546
41.9	0.068
71.1	0.638
85.2	0.034

4.1.4.2.6 Losses Model Parameters

HEC-HMS models watershed losses, which represent the fraction of precipitation that is captured and stored, and does not contribute to runoff. The chosen loss method was the linear deficient and constant method, appropriate for long term continuous modelling runs within HEC-HMS (USACE 2024). This method defines an initial deficient capacity for the watershed and accounts for changes in infiltration capacity as the soil becomes saturated.

These values were iteratively generated through model calibration. Impervious area has been set to 0 as the watersheds cover naturalized land areas with minimal impervious land. Model input parameters are summarized in Table 4.9.

Table 4.9 HEC-HMS Loss Model Parameters

Parameter Name	Description	Unit	Input Value
Initial deficit	At the start of the simulation, it is the amount of water that would be required in order to fill the soil layer to the maximum storage	mm	72.38
Maximum deficit	the total amount of water the soil layer can hold, specified as an effective depth; best determined through calibration	mm	764.96
Constant rate	defines the infiltration and percolation rates when the soil layer is saturated	mm/hr	0.45
Impervious	percentage of the Subbasin Which is Directly Connected Impervious Area	%	0

4.1.4.2.7 Baseflow Model Parameters

The Recession Baseflow Method was used to define baseflow within the HEC-HMS models. Baseflow describes the fraction of flow that is present year-round as a result of groundwater inputs. The Recession Baseflow method defines initial discharge per area associated with each watershed. The initial discharge value comes from the results of the regional baseflow assessment, described within Section 4.1.2. The recession constant and ratio work to reset the baseflow contribution following storm events, making this baseflow method applicable for continuous modelling (USACE 2024). The parameter values are summarized in Table 4.10.

Table 4.10 HEC-HMS Recession Baseflow Parameters Summary

Parameter Name	Description	Unit	Input Value
Initial Discharge	Discharge per area; specifies the initial baseflow as a discharge with units of volume per time per area; based on result of the regional baseflow assessment.	$m^3/s/km^2$	0.0035
Recession Constant	Describes the rate at which baseflow recedes between storm events. It is defined as the ratio of baseflow at the current time, to the baseflow one day earlier.	-	0.999
Ratio	Ratio to Peak Threshold method; resets the baseflow during a storm event. Specified the flow ratio to the peak. The baseflow is reset when the flow divided by the peak flow falls to the specified value.	-	0.01

4.1.4.3 Model Calibration

An important step in developing a hydrological model is to calibrate the model using historical stream flows. The calibration process assist in the selection of an optimal set of model parameters, as were identified in Section 4.1.4.2.5, so the model can accurately predict flows. This study serves to provide a model to describe baseline conditions of the PA. Due to constraints within the project and limited temporal data from the local watersheds, the selected source for streamflow data to calibrate against comes from a nearby watercourse. Model calibration is based on available data from a nearby regional hydrological station operated by the WSC

The Porcupine River Hydrometric Data (HYDAT) station is the closest WSC regional flow station, with a total record from 1977-1995, and 2007-2022. This station is selected for model calibration due to its available data, proximity to the project study area watersheds (37 km SE), similar watershed size (408 km^2), and similar watershed characteristics. This station is also included in the regional hydrology assessment, as described in Section 4.1.2. In order to correctly relate stream flows recorded from the Porcupine River to watersheds in the LSA, recorded flows were extrapolated by drainage size to each of the three watersheds, generating a unique a streamflow time series for each model.

The widely accepted drainage-area ratio method (DARM) is used to develop daily timesteps of stream flow for three watersheds based on recoded flow in the Porcupine River. The DARM is a technique that statistically transfers same-day streamflow information from one location to another based on the change in drainage areas between both locations. The method estimates flow at an ungauged location by multiplying the measured flow at the nearby reference gauge by the area ratio of the ungauged to gauged drainage areas. This method is the most straightforward estimation approach for locations where no long-term streamflow data are available (USGS 2005; USGS 2006; and Gianfagna et al. 2015). Table 4.11 summarizes the ratios comparing drainage area between the referenced watersheds.

Table 4.11 Watershed Based Extrapolation Ratios to the Porcupine River HYDAT Station

Watershed	Drainage Area (km^2)	Ratio of Drainage Area to Porcupine River at Hoyle (Station 04MD004)
Porcupine River at Hoyle (Station 04MD004)	408	1.00
Jocko Creek	110	0.27
North Driftwood	383	0.94
West Buskegau	524	1.28

The time period 2008 – 2014 is selected for calibration since the recorded flows in this time period covered a range of high flow and low flow events. The Porcupine River at Hoyle station has data available until May 31, 2022. Beginning in 2014 until 2022, flow data quality issues were identified at Station ID 04MD004 by WSC due to backwater conditions from the operation of an Ontario Power Generation (OPG) dam downstream on Nighthawk Lake, localized beaver activity, and an upstream control dam at a tailing management facility (ECCC 2024). Impacted data from the 2014 to 2022 period was excluded from the analysis.

4.1.4.3.1 Meteorological Model Parameters

Within HEC-HMS, a meteorological model must be defined to establish atmospheric conditions of the model for the model run period. To accomplish this, nearby ECCC climate stations are used to provide daily temperature and precipitation depths for the models for the selected time period (Jan 1, 2008 until May 31, 2022) used for calibration.

A combination of the Timmins Climate station (6078262), Timmins Victor Power Airport station (VPA; 6078285) and Kapuskasing Station (6073975 /6073976 /6073978) are used to provide this data. A review of the climate data stations quality and selection process is discussed in detail within Section 5.1.7.

The Timmins VPA station provided consistent daily data for the model time period until 2009. Timmins Climate station became active in 2009 and became the primary source for meteorological data for the remaining calibration time period. The Timmins Climate station has missing temperature data for 80 days (1.5% of the data set) and missing precipitation measurements from 120 days (2.7% of the data set). The dataset was gap filled by linear interpolation when missing data was no more than two consecutive days of missing values. When data gaps were larger than two consecutive days, data from the Kapuskasing

Station was used for gap filling. The Kapuskasing station data accounts for 86 days of data, or 1.7% of the data set.

The Timmins Climate station recorded a 105.2 mm precipitation event on August 20, 2016. This precipitation event is in alignment with a 50-year storm and would have caused a significant hydrological response. However, the Porcupine station shows no hydrological response to this recorded event. To avoid model errors, this event was replaced with a less significant rainfall event that occurred on July 13, 2016, of 13.3 mm. This example evidences how variations in local weather patterns can impact results due to differences between model results and measured flows.

4.1.5 Regional Surface Water Quality

Regional surface water quality stations operated by the MECP as part of the Provincial Water Quality Monitoring Network (PWQMN) that monitor a suite of water quality parameters are selected to represent regional surface water quality relationships. This assessment examines water quality data at a regional scale, allowing for many years of water quality data from regional PWQMN sites to be analyzed allowing average and natural variability of parameters to be captured and assessed. This provides improved confidence in the surface water quality statistics, including identifying potential contaminants of concern.

The regional sites used in the baseline water quality analysis are presented below in Table 4.12 are selected to include in the assessment based on the following criteria:

- Located within a 200 km radius of the Project site
- Located upstream of pulp and paper effluent discharge points
- Located upstream of urban development areas
- Surface water quality monitoring data available for more than 10 years
- Surface water quality monitoring data preferably available within the last 25 years (1999) and ongoing collection

Table 4.12 Regional Surface Water Quality Sampling Locations

Station ID	Waterbody	NAD 83 UTM Zone 17N Coordinates	Distance to Site (km)	Period of Data Availability
19006401420	Mattagami River	473895m E, 5369134m N	24.71	1972 – Ongoing
19006404502	Porcupine River	483574m E, 5369945m N	25.26	1991 – Ongoing
19006400302	Porcupine River	487068m E, 5371339m N	25.36	1968 – 2005
19006400402	Porcupine River	495955m E, 5377416m N	26.34	1968 – Ongoing

Station ID	Waterbody	NAD 83 UTM Zone 17N Coordinates	Distance to Site (km)	Period of Data Availability
18771000602	Murdock Creek	570296m E, 5328291m N	115.40	1972 – 2003
18771000402	Blanche River	573257m E, 5316174m N	124.00	1972 – 2005
18013700102	Slate Creek	604928m E, 5251333m N	192.66	1988 – 2005

4.1.5.1 Data Analysis

Surface water quality data for each site, for each sampling event, are presented and compared against applicable regulatory guidelines. These include both the PWQOs (and Interim PWQOs where applicable) and CWQG-FALs.

Summary statistics are calculated for each parameter and include mean, minimum, maximum, standard deviation (std. dev.) and 75th percentile where applicable. Prior to calculating summary statistics for each parameter, results below the reportable detection limit (RDL) are processed based on guidance in Guidelines for Quality Assurance and Quality Control in Surface Water Quality Programs in Alberta (2006). The following criteria and treatments are applied to estimate a numerical value for values below the RDL at each Regional site:

- ≤15% of sample results below RDL – below RDL values represented as 50% of RDL value
- >15% and ≤50% results below RDL, and minimum 50 samples above the RDL value - probability plot regressions fitted to the above RDL data using the 5th percentile to replace non-detected sample results. To determine the 5th percentile, HYFRAN software (El Adlouni and Bobée 2015) is used to complete Lognormal, Weibull and Lognormal Pearson Type III regressions and selecting the regression with the best fit and fewest input parameters.
- >15% and ≤50% results below RDL, and minimum 30 samples above the RDL value – the above described probability plot regression approach is applied to the above RDL data and a note added to the results that the sample size may be inadequate to address potential outlier values. Additional water quality samples for this parameter would provide improved confidence in the non-detected sample results replacement value.
- >50% results below RDL – below RDL are not replaced with numerical values, and summary statistics are not calculated, besides the maximum parameter value.

Where RDL values were processed with numerical values, parameters are presented with respect to seasonal concentration differences (winter [January to March], spring [April to June], summer [July to September] and fall [October to December]).

4.2 Field Surveys

4.2.1 Hydrology

As part of the local hydrology baseline assessment, a field hydrometric monitoring program is conducted by WSP Golder, Stantec and Canada Nickel staff. WSP Golder installed the hydrometric stations and monitoring equipment between 2021 and 2022. WSP Golder, Stantec and Canada Nickel staff subsequently conducted equipment downloads and manual *in situ* flow and water level measurements. A total of 11 stations are installed at the Project site (Figure A-4, Appendix A).

Details for each station are presented in Table 4.13, including measurement history. A total of 6 stations were monitored for stage and discharge in 2021 with two field assessments, 10 sites in 2022 (one of which is a lake station to monitor stage) with quarterly monitoring when available, and 11 sites in 2023 (two of which were lake stations to monitor stage) with monthly monitoring when safe to do so. A hydrometric station summary sheet for each station describing the station and monitoring periods is presented in Table 4.13.

Table 4.13 Hydrometric Monitoring Stations

Station	NAD 83 UTM Zone 17N Coordinates	Drainage Area (km^2)	Observed Characteristics	Continuous and Manual Monitoring Period	Number of Manual Discharge Measurements	Number of Manual Stage Measurements

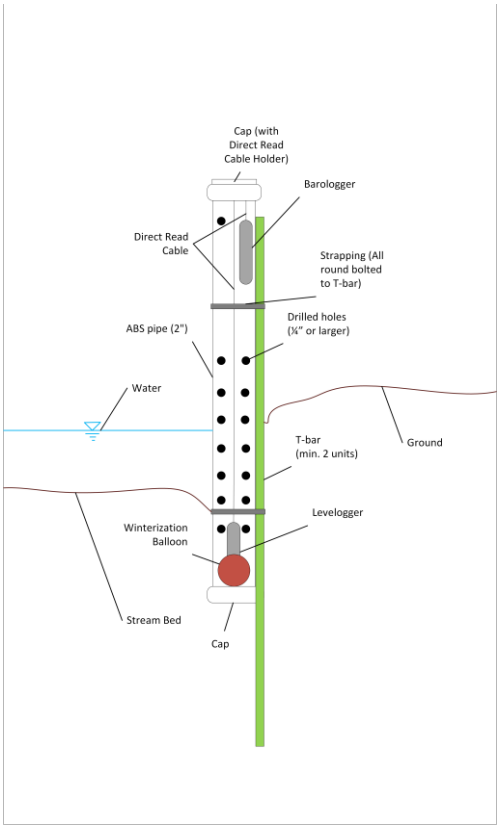
SuthLk	471002m E, 5404783m N	0.785	Continuous water level, water temperature	July 2023 - Ongoing	-	-
BARO	472764m E, 5408326m N	-	Atmospheric pressure, air temperature	July 2021 - Ongoing	-	-

Solinst Leveloggers® are installed at each station to monitor continuous water levels. A Solinst Barologger® is installed on site, located north of SW-9 along highway 655 to collect atmospheric pressure and air temperature data. This location was chosen as it was accessible for site staff and for being centrally located to the chosen hydrometric monitoring stations to provide accurate atmospheric data (Figure A.4, Appendix A). Figure 4.4 presents the typical stilling well setup for each of the 10 hydrometric stations.

Figure 4.4 Typical Stilling Well for Continuous Level Logger Installation



Each site has a staff gauge installed to allow manual water level measurements and support benchmark surveying for each site. Continuous water level and atmospheric pressure data is recorded at each site at a 30-minute frequency. The continuous water levels, water temperature, atmospheric pressure and air temperature data are processed in Aquarius™ hydrometric analysis software to barometrically compensate the Levelogger® water level data. The continuous water level data is also offset to compensate for differences between installed depth and thalweg channel depth and/or staff gauge measurements to support station rating curve development (e.g., stage: discharge relationships).

Manual measurements of streamflow are conducted using the Mid-Section Area-Velocity Method where the discharge is calculated from multiple velocity measurements and cross-section areas (Botma and Struyk 1971; WMO 2010a). Water velocity measurements under wadable conditions were conducted using either a Marsh-McBirney Flo-Mate 2000 with a topset wading rod or a FlowTracker2 (2021 to 2022). In 2023, all wadable flow measurements were captured with a FlowTracker2. During high flow events, either the Sontek M9 current profiler or the USGS Type AA Current Meter were utilized for data collection (2021 to 2022). In 2023, only the Sontek M9 is used during high flow events. The Marsh-McBirney Flow-Mate is a portable velocity flow meter type with an electromagnetic velocity sensor. The SonTek M9 and FlowTracker2 use acoustic doppler technology. Manual measurements are processed in Aquarius™ hydrometric analysis software to develop station rating curves.

The *in situ* continuous water levels and manual flow measurements are used to develop rating curves in the Aquarius™ software. The rating curve estimates continuous flows based on the relationship between water level and manual flow measurements. The WSC's manual for developing rating curves titled Hydrometric Manual – Data Computations (Rainville et al. 2016), World Metrological Organization (WMO) Manual on Stream Gauging, Vol. I: Fieldwork (2010a), WMO Manual on Stream Gauging, Vol. II: Computation of discharge (2010b) are used in this study to support rating curve development. The rating curve equation applied is listed in Eqiation 4-7 (Rainville et al. 2016).

$$\boldsymbol{Q = C\,(h + a)^n} \qquad \textbf{Equation 4-7}$$

Where:

Q	= discharge (m^3/s)
C, n	= constants
h	= gauge height/offset (m)
a	= stage at zero flow

4.2.1.1 Bathymetry

Canada Nickel staff conducted bathymetric surveys in eight lakes potentially overlain by Project activities, receiving effluent discharge or within watersheds potentially disturbed or altered by Project activities. The project site lakes are listed as follows:

- Gerry Lake
- Jack Lake
- Mel Lake
- Martin Lake
- Sutherland Lake
- Zed Lake
- Unnamed Lake South of Zed Lake
- Unnamed Lake LG Stockpile

Bathymetry data is collected from the project lakes by using a combined GPS/sonic transducer. The surveys are completed in alignment with the field methods provided in the Manual of Instructions for Bathymetric Surveys published by the MNRF (Levec and Skinner 2004). Vertical and horizontal resolutions are approximately +/- 0.1 m and 4.0 m respectively.

Lake perimeters from base mapping are digitized into a GIS database to calculate surface area and perimeter. Bathymetric data are used to determine maximum depth and digitized to estimate lake volume and calculate mean lake depth.

4.2.2 Surface Water Quality

4.2.2.1 Monitoring Period, Frequency, and Locations

Surface water quality monitoring sites in watercourses and waterbodies were selected based on the following criteria:

- Proximity of surface waters to receiving mine water discharge
- Proximity to the proposed tailings management facility (TMF)
- Waterbodies in the PA of importance to Indigenous nations
- Alignment with other monitoring programs (i.e. surface water quantity and fisheries)

Monitoring activities have been conducted by WSP Golder (2021, 2022, 2023) and Canada Nickel staff (2023).
The sampling frequency occurred annually, quarterly, bi-monthly, or monthly, with some locations as single sampling events. Sampling conducted in 2021 involved 19 sites. In 2022, 13 additional water quality monitoring sites were added to the program. In 2023, 13 sites were added to the monitoring program. The sampling locations are summarized in Table 4.14 and presented in Figure A.5, Appendix A.

Table 4.14 Local Surface Water Quality Monitoring Stations

Watershed	Station ID	Watercourse/ Waterbody Type	Reference/Rationale	Sampling Frequency	Monitoring Period
Jocko Creek	JCRK-01	Watercourse	To constrain and characterize effects of the Kidd Creek Mine on water quality of the Mattagami River.	Quarterly	May 2023 – November 2023
	JCRK-02	Watercourse	Upstream of proposed TMF	Monthly	February 2023 – December 2023
	JCRK-03	Watercourse	Jocko Creek, downstream from highway 655	Monthly	February 2023 – October 2023
	JC-S-01	Watercourse	South of proposed tailings facility	Monthly	May 2022 – December 2023
	KC-01	Watercourse	To constrain and characterize effects of the Kidd Creek Mine on water quality of the Mattagami River	Monthly	February 2023 – April 2023
	MATR-01	Watercourse	Proximate to a proposed discharge location and aligns with fisheries program.	Monthly	October 2021 – November 2023
	MATR-02	Watercourse	Downstream of proposed discharge location.	Quarterly	October 2021 – December 2023

Watershed	Station ID	Watercourse/ Waterbody Type	Reference/Rationale	Sampling Frequency	Monitoring Period
	MATR-REF	Watercourse	Mattagami River US of Lower Sturgeon Dam, upstream of Project discharges and confluence of Jocko Creek.	Monthly	May 2023 – November 2023
	UWC-01	Watercourse	Unnamed wetland/watercourse	Quarterly	February 2023 – October 2023
North Driftwood	DAVLK	Lake (Waterbody)	Davis Lake, proximate to the proposed TMF and process plant area	Quarterly	June 2022 – September 2022
	GERLK	Lake (Waterbody)	Gerry Lake, proximate to the proposed TMF and process plant area	Quarterly	August 2021 – December 2023
	JACLK	Lake (Waterbody)	Jack Lake, proximate to the proposed TMF and process plant area	Monthly	June 2022 – October 2022
	MARLK	Lake (Waterbody)	Martin Lake, proximate to the proposed TMF and process plant area	Monthly	August 2021 – December 2023
	MELLK	Lake (Waterbody)	Mel Lake, proximate to the proposed TMF and process plant area	Single event	September 2022
	SUTHLK	Lake (Waterbody)	Sutherland Lake, proximate to the proposed TMF and process plant area	Quarterly	September 2022 – October 2023
	NDR-P-01	Pond (Waterbody)	Small unnamed waterbody, North Driftwood River subwatershed	Quarterly	August 2021 – October 2022
	NDR-P-02	Pond (Waterbody)	Small unnamed waterbody, North Driftwood River subwatershed	Quarterly	August 2021 – October 2022
	NDR-P-03	Pond (Waterbody)	Small unnamed waterbody, North Driftwood River subwatershed	Quarterly	August 2021 – October 2022
	NDR-P-04	Pond (Waterbody)	Small unnamed waterbody, North Driftwood River subwatershed	Quarterly	August 2021 – October 2022
	NDR-P-05	Pond (Waterbody)	Small unnamed waterbody, North Driftwood River subwatershed	Quarterly	June 2022 – September 2022
	NDR-P-06	Pond (Waterbody)	Small unnamed waterbody, North Driftwood River subwatershed	Quarterly	August 2022 – October 2022
	NDR-P-07	Watercourse	Small unnamed tributary,	Quarterly	June 2022 – October 2022

Watershed	Station ID	Watercourse/ Waterbody Type	Reference/Rationale	Sampling Frequency	Monitoring Period
			North Driftwood River subwatershed		
	NDR-S-01	Watercourse	North Driftwood River, Main Stem	Quarterly	August 2021 – October 2022
	NDR-S-02	Watercourse	To support continuity and anticipated requirements for effects monitoring before and during proposed diversion of the North Driftwood.	Monthly	August 2021 – December 2023
	NDR-S-04	Watercourse	Proximate to proposed rock stockpile area, water diversion, and highway 655 relocation	Monthly	August 2021 – October 2022
	NDR-S-04b	Watercourse	Proximate to proposed rock stockpile area, water diversion, and highway 655 relocation. Downstream replacement for NDR-S-04, which will be overprinted.	Monthly	February 2023 – December 2023
	NDR-S-05	Watercourse	North Driftwood River, Main Stem	Two sampling events	June 2022 – August 2022
	NDR-S-06	Watercourse	Downstream of Project influences, likely will correspond to the local study area boundary for the Project	Monthly	June 2022 – December 2023
	NDR-TRIB-01	Watercourse	Small unnamed tributary, North Driftwood River subwatershed	Bi-Monthly	August 2021 – October 2022
	NDR-TRIB-02	Watercourse	Small unnamed tributary, North Driftwood River subwatershed	Quarterly	August 2021 – October 2022
West Buskegau	PRSLK	Lake (Waterbody)	Prosser Lake, within the vicinity of the planned TMF	Quarterly	February 2023 – November 2023
	BS-SW-01	Watercourse	Small unnamed wetland/tributary north of site	Monthly	May 2023 – August 2023
	PC-01	Watercourse	Tributary to the main stem of West Buskegau, proximate to planned TMF. Relocated and renamed from WBR-S-01.	Quarterly	March 2023 – December 2023
	WBR-P-01	Watercourse	Small unnamed wetland/tributary West Buskegau River	Annually	August 2021 – June 2022
	WBR-P-02	Watercourse	Wetland/tributary to the main stem of West Buskegau, proximate to rock storage facility	Single event	August 2021

Watershed	Station ID	Watercourse/ Waterbody Type	Reference/Rationale	Sampling Frequency	Monitoring Period
	WBR-P-03	Watercourse	Small unnamed wetland/tributary West Buskegau River	Monthly	September 2022 – December 2023
	WBR-P-04	Watercourse	Small unnamed wetland/tributary West Buskegau River	Monthly	September 2022 – December 2023
	WBR-S-01	Watercourse	West Buskegau River, Main Stem	Quarterly	August 2021 – August 2022
	WBR-S-02	Watercourse	West Buskegau River, Main Stem	Quarterly	August 2021 – June 2022
	WBR-S-03	Watercourse	West Buskegau River, Main Stem	Quarterly	August 2021 – September 2022
	WBR-S-04	Watercourse	Proximate to rock storage area, West Buskegau River, Main Stem	Monthly	August 2021 – December 2023
	WBR-S-05	Watercourse	West Buskegau River, Main Stem	Single event	September 2022
	WBR-S-06	Watercourse	Downstream of outflows from Prosser Lake and the TMF, proximate to the open pit	Monthly	February 2023 – October 2023
	WBR-S-07	Watercourse	Downstream of all potential Project effects, likely correspond to the local study area boundary for the Project	Quarterly	February 2023 – December 2023
	WBR-S-REF	Watercourse	Upstream reference site for the Project	Quarterly	March 2023 – December 2023

4.2.2.2 Monitoring Methods

Surface water monitoring was completed by both WSP and Canada Nickel staff. For each monitoring event, water samples were collected for submission to a Canadian Association for Laboratory Accreditation (CALA)-accredited laboratory following chain of custody protocols for analysis. Throughout the duration of the project, samples have been sent to two companies, ALS Environmental Laboratories (ALS) and Testmark Laboratories (Testmark). From August 2021 to October 2022, primary and duplicate samples were sent to ALS for analysis. In addition, samples for some sampling events in June and July 2023 were sent to ALS for analysis. From February 2023 to present, primary and duplicate samples have been sent to Testmark laboratories for analysis. In addition, *in situ* surface water quality was monitored using a calibrated YSI DSS multi-parameter probe. The *in situ* parameters included water temperature, pH, conductivity, dissolved oxygen (DO), oxidation reduction potential (ORP), and turbidity (added in 2023). Water samples were collected following standard protocols for grab sampling, sample vial labelling, sample storage and shipping in coolers at approximately four degrees Celsius (°C), and

completion of Chain of Custody (CoC) sample submission documentation. Water samples for ALS were submitted to their laboratory in Waterloo, ON, and samples for Testmark were sent to their Timmins, ON location.

Field sampling involved the following general steps:

- Analytical QA/QC in the ALS and/or Testmark labs
- Field verification of proposed water quality station locations
- GPS siting of monitoring station
- Completion of a field data sheet
- Measurement of *in situ* water quality parameters (colour, clarity, odour, temperature, conductivity, pH, turbidity, and dissolved oxygen) using a multiparameter sonde and visual observations at the time of analytical sample collection
- Shipping of water samples to Testmark ALS and/or Testmark labs for analysis

Sampling QA/QC is in keeping with laboratory, regulatory, and industry standards. QA/QC includes the following measures:

- Laboratory sample vial pre-labelling
- Trained and experienced sampling technician team consisting of at least two persons
- Routine random duplicate samples and field blanks
- Primary CoC form completion, with secondary review by alternate sampling technician
- Appropriate shipping protocols to maintain integrity of the samples received at the lab

Field meters used to collect *in situ* water quality data were calibrated with certified standard solutions and as per manufacturer maintenance manual guidance. Pre-cleaned and pre-labelled bottles and nitrile gloves were used for sample collection to minimize cross-contamination. Water samples were preserved on site with preservatives provided the laboratory and were stored at 4°C until analysis. Samples submitted to the laboratory that required filtration (e.g., dissolved metals) were field filtered prior to shipment. Samples that required filtration were submitted to the Testmark laboratories within recommended hold times to allow for laboratory filtration. Field blanks were collected to check for potential cross-contamination during field collections and with sample storage and transport, respectively.

Field duplicates were collected during each monthly sampling event with 22 duplicate samples out of 317 total samples collected. Field precision was determined by measuring the difference between the collected field data and its field duplicate using relative percent difference (RPD) calculations.

4.2.2.2.1 Lake Profiles

For select lakes, temperature and DO measurements were collected using a calibrated YSI DSS multi-parameter probe to assess the vertical profile in spring, summer, and fall. Measurements were collected at 1 m depth intervals, targeting the deepest part of the waterbody. Lake profile data were collected by WSP in 2022 and 2023 (WSP 2024).

4.2.2.2.2 Laboratory Methods

All water samples were shipped to ALS (2021 to 2023) and Testmark (2023) in Timmins, Ontario, which then shipped the samples to labs across Canada depending on parameter analysis required. Prior to conducting sampling, the required analytical parameters, WQGs, and detection limits were discussed with ALS and Testmark.

Analytical RDLs were selected based on PWQOs and CCME CWQG-FALs values, and RDLs listed in the MDMER Schedule 3 Tables 1 and 2. Adherence to required detection limits was adequate; however, detection limits varied at times due to sample dilution or analytical interference.

The analytical suite includes all the parameters listed in section 47. (2) of O.Reg. 35/24 and the baseline parameter list in the MDMER. Total and dissolved metals were analyzed. To investigate the nutrient status of the system, several nutrients were analyzed.

4.2.2.2.3 Laboratory Quality Assurance/Quality Control

Laboratory quality control programs included analysis of certified reference materials, laboratory control samples, laboratory duplicates, method blanks and matrix spikes to determine accuracy and precision of instrumentation and methods. Data reports submitted by ALS/Testmark were reviewed upon receipt to check that the reported data met the laboratory data quality objectives (DQOs). In instances where method recovery was not accurately calculated due to matrix interferences, detection limits were adjusted to prevent influence on analytical results. Data QA/QC controls included:

- Analytical QA/QC in the Testmark and/or ALS labs
- Analytical data review by qualified person subsequent to laboratory reporting
- Statistical analyses to detect data outliers and avoid analytical skew from data anomalies

4.2.2.2.4 Data Analysis

Surface water quality data for each site, for each sampling event, are presented and compared against applicable regulatory guidelines. These include both the PWQO (and Interim PWQOs where applicable) and CWQG-FAL. The data analysis approach for calculating summary statistics is discussed in Section 4.1.5.1. For local water quality data analysis, summary statistics are generated for parameters based on grouping stations in waterbodies and watercourses.

Where RDL values were processed with numerical values, parameters are presented with respect to seasonal concentration differences (winter [January to March], spring [April to June], summer [July to September] and fall [October to December]). PoPCs where the 75th percentile exceeds the PWQO criteria and classifies the receiver as a Policy 2 receiver for that parameter, are identified and further analyzed by each watershed.

5 Baseline Conditions for Surface Water Resources

5.1 Physiographic Setting

The physiographic setting descriptions align with the following baseline studies: 2021-2023 Fish and Fish Habitat Baseline Report (Appendix B.7.4 of the Impact Statement), Soils and Terrain Baseline Report (Appendix B.1 of the Impact Statement), Vegetation, Riparian and Wetland Environments Supplemental Baseline Report (Appendix B.7.1 of the Impact Statement) and Terrestrial Wildlife and Wildlife Habitat Supplemental Baseline Report (Appendix B.7.3 of the Impact Statement).

5.1.1 Physiography

The Project site is located within the Lake Abitibi Ecoregion of Ontario (Ecoregion 3E), a part of the Ontario Shield. This ecoregion is identified as a Humid Mid-Boreal Ecoclimatic Region, characterized by long, cold, and snowy winters, with short and mild summers (Ecoregions Working Group 1989). This region sits on top of the Precambrian Shield, with diverse surficial geology. Local site watersheds have organic, and clay dominant soils and land cover is primary forested with a significant presence of wetlands, such as swamps or marshes, open water areas and rivers (OMAFRA 2023; MNRF 2023a).

5.1.2 Topography

The topography of the PA is defined by a client provided LiDAR DEM and supplemented with provincially available topographic contour mapping (MNRF 2023b). The three Project study watersheds (Jocko Creek, North Driftwood, and West Buskegau Rivers) are relatively flat, with an overall topographic average slope of 1.7% for the entire Project study area (Figure A.3, Appendix A).

Elevations within the Jocko Creek watershed range from a minimum of 258.9 meters above sea level (masl) at subwatershed JCDS to a maximum of 322.3 masl within JC2, with an overall average slope of 1.8%. The North Driftwood watershed ranges from a minimum of 248.2 masl at the outlet of the watersheds within sub-basins ND1 and ND2, and a maximum of 303.1 masl within ND23 with a total average slope of 1.8%. The West Buskegau watershed has a minimum elevation of 260.9 masl at the watershed outlet within WB1, and a maximum elevation of 356.1 masl within the subbasin WB27, with a total average slope of 1.6% (Figure A.3, Appendix A). The average topographic elevation for all three watersheds is 276.7 masl. Channel slopes of the watershed vary from 0.05% within the West Buskegau, 0.08% within North Driftwood, and 0.11% at Jocko Creek according to OWIT (MNRF 2023a).

5.1.3 Vegetation

The OWIT assessment identified the PA to be covered primarily by mixed forests and coniferous forests (approximately 50%), as well as bogs and swamps (approximately 25%), with remaining land cover as either sparsely treed (approximately 15%), or as disturbance, fens, or open water (MNRF 2023a). Typical boreal vegetation found in this region include black spruce, tamarack, jack pine, trembling aspen, and white birch (Rowe 1972).

5.1.4 Watershed Delineation

The Jocko Creek watershed was determined to have a total area of 109.6 km^2, further delineated into 3 subwatersheds. The North Driftwood River watershed has a total area of 383.3 km^2, discretized into 23 subwatersheds. Lastly the West Buskegau River watershed is found to be 524.1km^2, split into a total of 27 subwatersheds. The North Driftwood River watershed outlet was selected to be downstream of the potential LSA boundary at the next major confluence, which was immediately downstream of the junction with Lennox Creek. The West Buskegau River watershed outlet was selected to be at the next major confluence downstream of the potential LSA, which was immediately downstream of the junction with Reamue Creek. The Jocko Creek watershed outlet was selected to be downstream of the expected influence of the PA activities and prior to the confluence with Kidd Creek. Watershed and subwatershed characteristics tables are provided in Appendix B.1. Figure A.3 within Appendix A presents the watersheds and subwatersheds of the study area.

5.1.5 Water Resources

As described, the delineated local watersheds include the Jocko Creek watershed, the North Driftwood River watershed, and the West Buskegau River watershed (Figure A.3, Appendix A).

Jocko Creek leads into the Mattagami River, draining northwards towards James Bay. Mattagami River confluences with the Missinaibi River, which combines into the Moose River, one of the major rivers leading into the James Bay. At the point of the Jocko Creek confluence, the Mattagami River covers a drainage area of 38,700 km^2 with a main channel length of approximately 550 km (MNRF 2023a). Jocko Creek is the southernmost watershed in the PA, closest to the City of Timmins. Lakes cover less than 0.5% of the Jocko Creek watershed area (MNRF 2023a). Within the Jocko Creek watershed, Zed Lake and an unnamed lake south of Zed Lake are included in the bathymetric assessment described in Section 5.2.3.3.

The North Driftwood River connects with the Abitibi River, which continues on to confluence with the Moose River, about 55km downstream from where the Mattagami River confluences with it as well. The North Driftwood watershed has less than 0.6% of the watershed area covered by lakes (MNRF 2023a). Lakes found in this watershed that are also included in the bathymetry assessment include Martin Lake, Gerry Lake, Jack Lake, Mel Lake, and Sutherland Lake. These lakes are found north of the Zed Lake in the Jocko Creek watershed, within subwatersheds ND19 and ND20.

West Buskegau drains northwards and connects with the Abitibi River 25 km upstream from where the North Driftwood River meets with the Abitibi River. The West Buskegau watershed contains a slightly greater proportion of lakes, covering about 0.9% of its total drainage area (MRF2023a). The lakes found in the West Buskegau include Prosser Lake in WB20, near the Jocko Creek Watershed, Sawmill Lake, Nerandeau Lake, and Lizard Lake in WB27.

5.1.6 Local Water Users

Ontario Power Generation (OPG) is currently operating a hydroelectric dam on the Mattagami River downstream from the Project site. The facility is called the Lower Sturgeon Generation Facility and has been in operation since 1923, providing 14 Megawatts (MW) of energy production to its end users (OPG 2024). The WSC operates a HYDAT station on the Mattagami River located just south of Timmins. This station is used for monitoring water level and flow.

A review of the MECP water well record found that >60 wells were noted to be located near the Project Site area (MECP 2024). Active wells include those used for commercial business, Bush Camps, or domestic water supply. The Groundwater Baseline Report (Appendix B.5 of the Impact Statement) Section 5.4 describes in detail the use of wells and history of well use in and around the Project RSA.

5.1.7 Climate

As MSC had not updated local climate station climate normals at the time of writing, an ensemble of historical climate stations from ECCC (2023a) were used to project the 1991-2020 climate normal. The historical climate stations in Table 5.1 are within a 100 km range of the Project, have more than 10 years of data, and have datasets that have a record period that includes more recent data trends (2000's and later). The climate stations were compared with each other to determine the climate data that best represents the PA and to form an ensemble of stations to represent conditions to present.

Table 5.1 Regional Climatic Stations

Station ID	Station Name	Coordinates	Record Period (Total)	Data Interval	Elevation (masl)	Distance from Site (km)	Comments
6078286	Timmins A	48°34'14" N 81°22'36" W	2012 – 2023 (12)	Hourly Daily	294.7	26.20	Missing precipitation, rain, and snow data
6078285	Timmins Victor Power A	48°34'11" N 81°22'36" W	1951 – 2012 (62)	Hourly Daily Monthly	294.7	26.29	Full precipitation, rain and snow Data set until 2009
6078262	Timmins Climate	48°33'26" N 81°23'25" W	2008-2023 (16)	Hourly Daily	294.4	27.73	Missing rain and snow data
6070QK6	Bonner Lake	49°23'00" N 82°07'25" W	1990 – 2023 (34)	Daily Monthly	245.0	84.43	Gaps in rain and snow data and data not subject to review
6073960 /6073980	Kapuskasing CDA	49°24'00" N 82°26'00" W	1918-2023 (106)	Daily Monthly	217.9	100	Missing rain and snow data
6073975 /6073976 /6073978	Kapuskasing A	49°24'50" N 82°28'03" W	1937-2023 (87)	Hourly Daily Monthly	226.5	100	
Source: ECCC 2023a							

The Timmins A (6078286), Timmins Victor Power A (VPA; 6078285), and Timmins Climate (6078262) stations are located within the closest proximity to the Project site and have elevations consistent with the PA (265 to 290 masl). Timmins VPA has a mostly complete data set from 1951 up to 2012 for temperature, and a mostly complete data set from 1951 to 2009 for precipitation. Although Timmins Climate has climate data from 2008 through 2023, the rain and snow data are not consistently reported for this period. The Timmins A station cannot be used to infill the missing Timmins Climate data as it does not start collecting precipitation, rain, and snow data until after 2021. Bonner Lake (6070QK6) has gaps in the snow and rain data, and the presented data available is not subject to review by the National Climate Archives. The Kapuskasing stations (6073960, 6073980, 6073975, 6073976, 6073978) are located a considerable distance from the site (100 km) and are not within the range of elevations within the PA, and thus may represent different climatic conditions than observed on site.

The 1991-2020 climate normal precipitation and temperature data was developed using Timmins VPA observations used from 1991 through 2009 for precipitation and 1991 through 2012 for temperature. The Timmins Climate station data supplemented the Timmins VPA data from 2009 to 2020 for precipitation and 2012 to 2020 for temperature to compute the updated climate normals.

5.1.7.1 Temperature

From the generated climate normal (1991-2020) dataset, average monthly and annual temperatures were estimated, as shown in Table 5.2. The climate normal mean temperature ranges from -16.4ºC in January to 17.6ºC in July.

Table 5.2 1991-2020 Temperature Climate Normal for Combined Timmins VPA and Timmins Climate Stations

Month	Average Temperature (ºC)
January	-16.4
February	-14.2
March	-7.6
April	0.9
May	9.7
June	15.3
July	17.6
August	16.2
September	11.8
October	4.6
November	-3.0
December	-11.2
Total	**2.0**

5.1.7.2 Precipitation

The climate normal annual precipitation from the combined stations for the 1991-2020 period is presented in Table 5.3.

Table 5.3 1991-2020 Precipitation Climate Normal for Combined Timmins VPA and Timmins Climate Stations

Month	Total Precipitation (mm)[1]
January	48.2
February	39.6
March	48.8
April	60.3
May	64.6
June	80.8
July	82.7
August	80.2
September	84.6
October	86.1
November	70.9
December	54.8
Total	**801.8**

Note:
1 wet equivalent precipitation

The annual climate normal precipitation was found to be 801.8 mm, a 4% decrease in total precipitation from the 1981-2010 climate normal presented by the ECCC for the Timmins VPA station of 834.6 mm (ECCC 2023b). A difference of 4% between the two climate normal periods likely result from changes in climatic conditions at the stations as well as the inclusion of data from the Timmins Climate station for precipitation recordings from 2009 to 2020.

The wet and dry years assessment was performed using the record of Timmins VPA station (1956 – 1990) and the combined station record used for determining updated climate normal years record for 1991-2020, as described in Section 5.1.7, yielding a total record of 64 years. The wettest year on record was 1961 with annual total precipitation amount of 1,129.7 mm, representing an event between the 100 and 200-yr return period. The driest year on record was 2010, with an annual precipitation amount of 521.4 mm, representing a dry year event with a return period of between 50 and 100 years. Table 5.4 summarizes the wet year and dry year return periods for annual precipitation.

Table 5.4 Wet and Dry Year Total Precipitation Return Periods

Return Period (Year)	Wet Year (mm)	Dry Year (mm)
5	940	680
10	981	634
25	1,034	579
50	1,073	541
100	1,113	505
200	1,152	472

Snow data is limited at the ECCC climate stations relevant to the Project. As identified in Table 5.1, most stations have no snow depth data, or inconsistent snow depth measurements. Only the Timmins VPA station has maintained snow depth information from 1955 until 2009. Since consistent snowfall data is not available for beyond 2009, the 1980-2010 climate normals from ECCC are provided to characterize snowfall at the site (Table 5.5).

Table 5.5 Timmins VPA Climate Station (6078285) Snow Statistics Summary (1981 - 2010 Climate Normal)

	Snowfall (cm)	Average Snow Depth (cm)	Median Snow Depth (cm)	Snow Depth at Month end (cm)	Extreme Daily Snowfall (cm)	Date (yyyy/dd)
January	57.8	53	53	62	33	1962/07
February	45.9	64	64	63	37	1999/28
March	44.8	54	54	34	48.2	1983/19
April	27.2	18	16	4	36	1985/06
May	5	1	0	0	17	1986/01
June	0.2	0	0	0	2.6	1980/10
July	0	0	0	0	0	1955/01
August	0	0	0	0	0	1955/01
September	1	0	0	0	7.2	1989/23

5.1.7.2.1 Intensity Duration Frequency Curve

An intensity-duration-frequency (IDF) curve was obtained from ECCC using a composite dataset of Timmins stations from 1952 through 2021 using a Gumbel distribution and the method of moments. The composite Timmins stations had a combined 61 years of data, with the IDF curve results presented in Table 5.6 and Table 5.6 and in Figure 5.1.

Table 5.6 Intensity-Duration-Frequency Curves for Combined Timmins Stations

Duration	Total Rainfall (mm)					
	2 Year	**5 Year**	**10 Year**	**25 Year**	**50 Year**	**100 Year**
5 minute	6.8	8.9	10.3	12.0	13.3	14.6
10 minute	9.9	13.4	15.7	18.6	20.7	22.9
15 minute	11.8	16.1	18.9	22.5	25.1	27.7
30 minute	15.1	21.4	25.6	30.9	34.8	38.7
1 hour	18.2	25.6	30.5	36.7	41.3	45.8
2 hour	21.8	29.4	34.4	40.8	45.6	50.2
6 hour	29.4	40.8	48.6	58.2	65.4	72.6
12 hour	36.0	50.4	61.2	73.2	81.6	91.2
24 hour	45.6	64.8	76.8	93.6	106	118

5.1.8 Climate Change

Impacts from climate change to the LSA is necessary to consider, as warming of 1.3°C of Canada's climate between 1948 and 2016 has been observed (Bush and Lemmen 2019). Northwestern Ontario has observed an increase of 2.4°C between 1970 and 2020, with a greater ratio of winter precipitation falling as rain (MNRF 2021).

Modelled climate change projections coming from the ensembled CMIP6 models, distributed through Climatedata.ca are provided in 30-year time frame projection periods. Based on the Project temporal scale of three years of construction, 41 years of operations, five years of active closure, and further into the post-closure period, projections of climate change impacts for the 2071-2100 years are considered to include the active mine, closure, and post-closure period.

Changes in temperature and precipitation are described in the ensuing sections using the moderation emissions scenario, defined as SSP2-4.5, as recommended by the CSA (2019). Climate change modelled results for the time period of 2071-2100.

5.1.8.1 Temperature

Projected changes in temperature under the 2071-2100 period are provided for the moderate emissions scenario, SSP2-4.5, in Table 5.7. Modelled results for the low and high emissions scenarios, SSP1-2.6 and SSP5-8.5, are provided in Appendix B.3. Results come from the ensembled CMIP6 models, provided by Climatedata.ca (2024), which use 1971 – 2000 as a reference period for comparison.

Table 5.7 Projected Temperature Changes at Timmins Climate Station - SSP2-4.5, Projection Period 2071-2100, relative to 1971-2000 Climate Normal

Parameter	Spring	Summer	Autumn	Winter
Median Change in Temperature	+3.9˚C	+3.7˚C	+3.6˚C	+5.3˚C
90th percentile confidence interval	+2.8˚C – +5.2˚C	+2.5˚C – +5.6˚C	+3.1˚C – +5.8ºC	+4.2˚C – +7.6ºC
Source: ClimateData.ca 2024				

The results of the ensembled models show that temperatures are expected to increase seasonally by on average 3.7˚C through the spring, summer, and autumn months. Winter months can expect significantly greater warming by 5.3˚C.

Increasing temperatures will affect runoff by impacting the spring freshet that comes as a consequence of snowpack melt. Warmer temperatures in northern Ontario would lead to less snow and ice buildup over the winter months, increase in evapotranspiration rates, changes to local growing seasons and water levels, and alterations to wetlands found in Northern Ontario (Dove-Thomson et. al. 2011). These changes would impact availability of water to streams and rivers in the LSA.

5.1.8.2 Precipitation

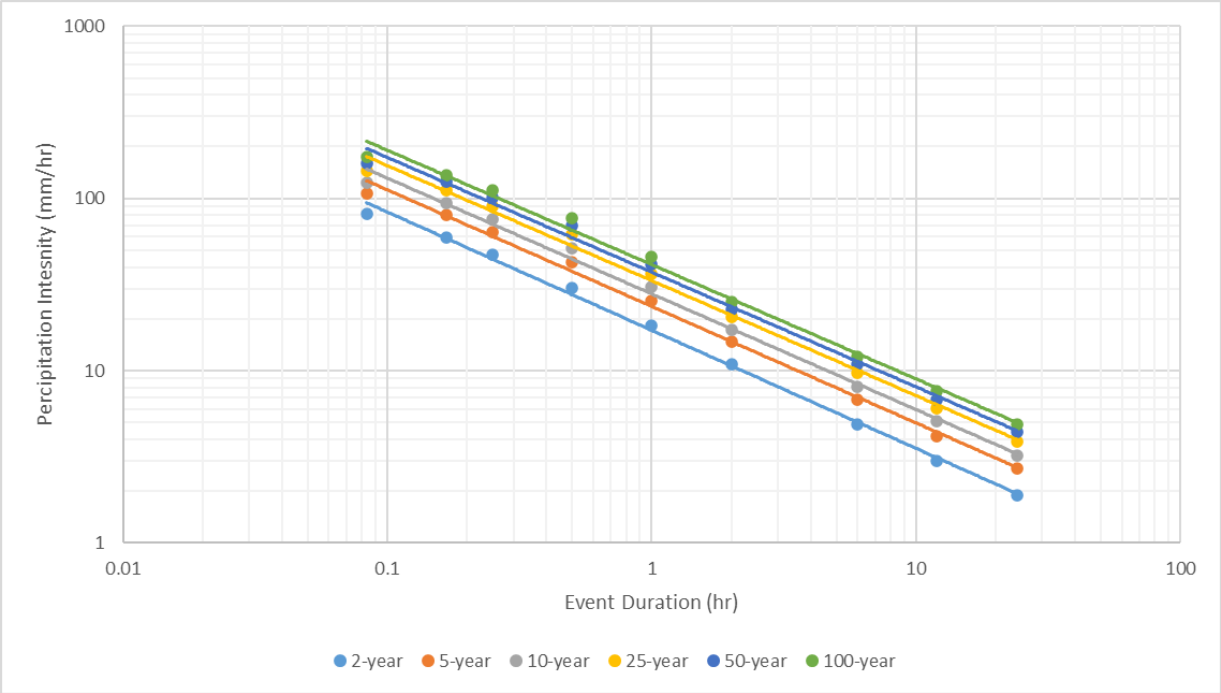
Projected changes in precipitation will affect the IDF curves at the 2071-2100 period. The impacted IDF curve is provided for the moderate emissions scenario, SSP2-4.5, in Table 5.8 and Figure 5.2.

Table 5.8 Projected IDF Curve at Timmins Climate Station - SSP2-4.5, Projection Period 2071-2100 - Converted to Total Rainfall Depths

Duration	Total Precipitation (mm)					
	2-year	5-year	10-year	25-year	50-year	100-year
5	8.8	11.5	13.3	15.6	17.3	18.9
10	12.8	17.3	20.3	24.0	26.8	29.7
15	15.3	20.8	24.5	29.0	32.5	36.0
30	19.5	27.5	33.0	40.0	45.0	50.0
60	24.0	33.0	39.0	48.0	53.0	59.0
120	28.0	38.0	44.0	52.0	60.0	64.0

Duration	Total Precipitation (mm)					
	2-year	5-year	10-year	25-year	50-year	100-year
360	37.8	52.8	60.0	78.0	84.0	96.0
720	46.8	64.8	79.2	94.8	106	118
1440	60.0	84.0	98.4	120	137	151
Source: Climatedata.ca 2024						

Figure 5.2 Projected IDF Curve at Timmins Climate Station - SSP2-4.5, Projection Period 2071-2100



Source: Climatedata.ca 2024

IDF curves for the low and high emissions scenarios (SSP1-2.6 and SSP5-8.5) as well as the relative percent difference comparison tables are provided in Appendix B.3. In reference to the IDF curve presented in Section 5.1.7.2 0, overall precipitation amounts for storms of all durations and events have increased by an average of 22.7% under the SSP2-4.5 emissions scenario. The SSP1-2.6 and SSP5-8.5 scenarios see relative percent difference increases of 15.9% and 36.2%, respectively. In general, for the projection period of 2071-2100, the PA should expect increased precipitation intensities from storm events of all durations and return periods in reference to the present day IDF-curve (ECCC 2023c; Table 5.6)

The 2071—2100 climate normal total precipitation was generated using the CanDCS-u6 26 models ensemble within the CMIP6 model ensemble. A GEV extreme precipitation block maxima and minima distribution curve is fitted to obtain the 50-year and 100-year return period annual total precipitation amounts for the wet and dry year, respectively, for each of the 26 models within the SSP2-4.5 CMIP6 ensemble. The monthly wet and dry return period quantities are based on relative percentages of annual precipitation for the 2071-2011 climate normal monthly amounts. The climate change adjusted wet year, dry year, and climate normal total precipitation monthly and annual amounts are provided in Table 5.9.

Table 5.9 Combined Timmins Climate Stations Wet Year, Dry Year, and CMIP6 2071-2100 SSP2-4.5 Climate Normal - Annual & Monthly Total Precipitation (mm)

Condition	Wet Year (mm)		Dry Year (mm)		2071-2100 Climate Normal (mm)
Return Period->	**50 year**	**100 year**	**50 year**	**100 year**	
January	86.96	91.09	35.83	30.19	71.33
February	68.07	71.31	28.05	23.63	55.84
March	80.08	83.89	32.99	27.80	65.69
April	74.28	77.81	30.60	25.79	60.93
May	92.56	96.97	38.14	32.13	75.93
June	102.90	107.80	42.40	35.72	84.41
July	103.41	108.33	42.61	35.90	84.83
August	95.44	99.98	39.32	33.13	78.29
September	113.94	119.35	46.94	39.55	93.46
October	98.60	103.29	40.62	34.23	80.88
November	106.52	111.59	43.89	36.98	87.38
December	92.13	96.51	37.96	31.98	75.57
Annual	**1114.90**	**1167.92**	**459.34**	**387.03**	**914.54**

Relative to the present period climate normal value of 801.8 mm, the projected total annual precipitation for the 2071-2100 under the SSP2-4.5 scenario is a relative percent increase of 14%. Relative to the climate normal wet year and dry year assessment presented in Table 5.4, the wet year and dry year monthly and annual return periods are extended respectively (drier results for dry years, and wetter results for wetter years) indicating that while the climate will become generally wetter, the climatic range will widen, storm intensity will increase with longer periods of inter-event dry periods..

The total precipitation amounts for the 2071-2100 climate normal, and wet and dry years were derived from total precipitation in the CMIP6 CanDCS-u6 26 models ensemble for the period of 2071-2100. The climate change adjusted wet year, dry year, and climate normal rainfall and snowfall monthly and annual amounts are provided in Appendix B.3 and Figure A.6, Appendix A.

5.2 Hydrology

5.2.1 Regional Hydrology

The regional hydrology assessment is based on the WSC stations listed in Table 4.2. The results of this assessment allow for the development of equations that relate catchment area to flow. These relationships can then be applied to the watersheds at the Project site to assist with characterizing local hydrology. Hydrological relationships are calculated for the mean annual flow, mean monthly flow, peak flows, and low flows, as presented in the following sub-sections. Environmental flows are estimated using the Tessman method at a monthly scale using a decision matrix of mean monthly and mean annual flows, as discussed in Section 5.2.1.6.

5.2.1.1 Homogeneity Tests

The first step in the regional assessment is to verify the hydrologic homogeneity of the group of stations presented in Table 4.2. A station should not be eliminated because it failed a single homogeneity test but can be eliminated if it fails multiple tests demonstrating more heterogeneity than homogeneity. The following describes the homogeneity tests performed and their results. Appendix B.4 presents the overall summary table including the results summary of the tests performed.

5.2.1.1.1 Vegetation and Land Cover

Land cover classes were extracted from OWIT for each of the eight WSC stations being considered. OWIT was also used to extract the land cover information for the each of the three local watersheds (Jocko Creek, North Driftwood, and West Buskegau watersheds). The major land cover types of the LSA watersheds are mixed treed (27.3%), coniferous treed (20.8%), bog (15.5%), sparse treed (11.4%), swamp (10.5%) and disturbance (8.1%).

Of the identified eight WSC stations, there was little difference in primary land cover. Stations were primarily covered by mixed treed cover, varying between 31% - 45% of the total cover. Increased disturbance land cover areas were noted in the Stations 04LC003 and 04LE002 watersheds, making up 16% and 20% of their land, respectively.

5.2.1.1.2 Percent Area of Waterbodies

Area of wetlands and lakes is another output from OWIT that was collected for each of the WSC station watersheds. Area of wetlands and lakes was also collected for the three Project site watersheds and combined to represent the total site watershed. Percent area of waterbodies was then calculated using the total drainage area and the percent difference between the WSC stations to the Project site was assessed.

The total Project site watershed is estimated to have waterbodies covering 25% of its area (MNRF 2023a). Three WSC stations had a percent area of waterbodies that fell outside of a ±15% range from the Project site, Station 04LK001 (64%), and Station 02JC008 (8%). The other stations had a percent area of lake and wetlands ranging between 12% and 19%.

5.2.1.1.3 Annual Precipitation

OWIT provides the estimated annual total precipitation of the WSC watersheds using the 1981 – 2010 climate normal period. The WSC station annual precipitation amounts were compared to 1981 to 2010 climate normal precipitation of Timmins VPA Station (834.6 mm) by assessing relative percent difference.

Station percent difference in annual precipitation varied form a range between -8% up to 4%. On average, the percent difference from selected WSC stations and the Project site 1991-2020 climate normal value was -1%.

5.2.1.1.4 Unit Flow

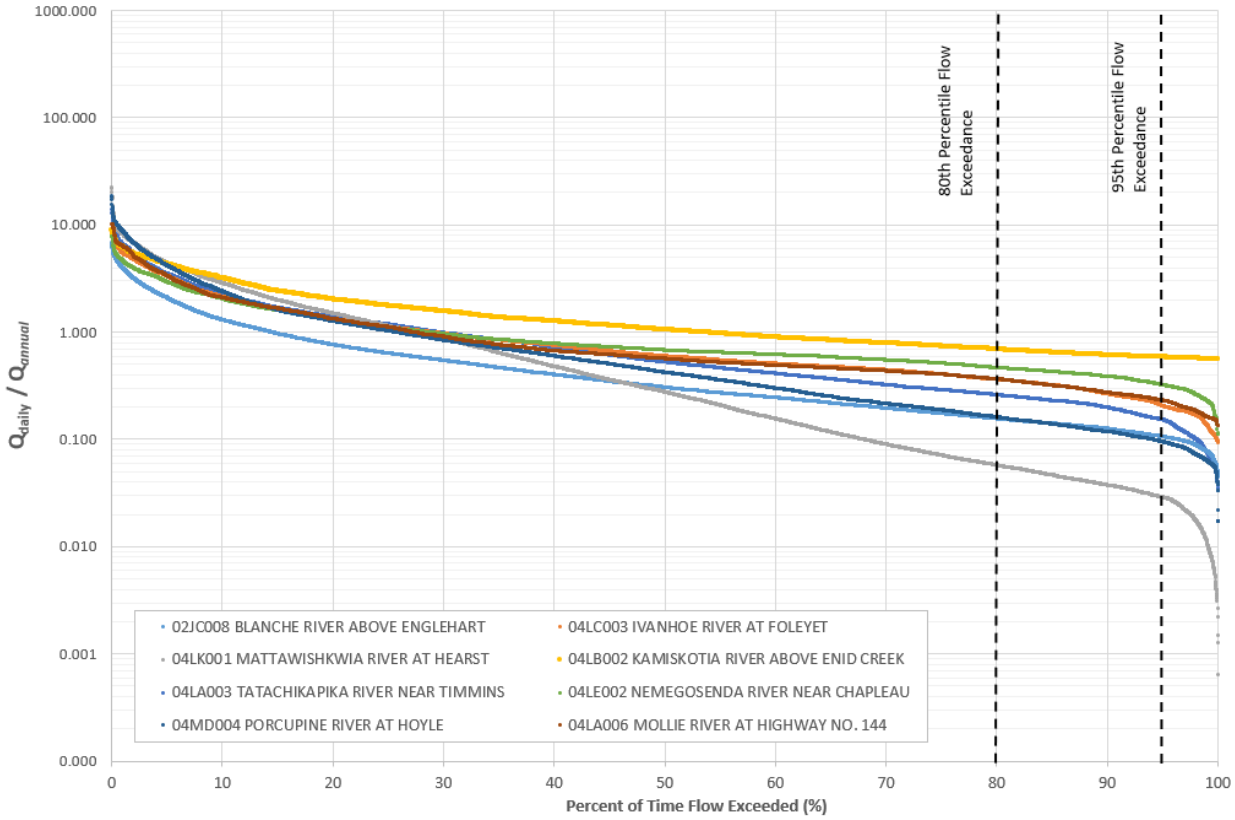
Unit flows were calculated for each WSC station by dividing the MAF by the associated catchment area to provide a unit of flow per square kilometre of catchment area. The unit flows for the WSC stations were averaged and their standard deviation was calculated. The average unit flow was 13.04 L/s/km^2 for the stations assessed, with a standard deviation of 3.62 L/s/km^2.

One station had a unit flow outside of one standard deviation from the average value, which was 02JC008 with a unit flow of 22.32 L/s/km^2. This station has the greatest drainage area (1780 km^2) and the least fraction of lakes and wetlands (8%) which likely contributes to the greater amount of surface runoff.

5.2.1.1.5 Flow Duration Curve

Flow duration curves for the WSC stations were developed following the methods described in Section 4.1.2 and the results are presented in Figure 5.3. The FDCs were normalized to present a range of flow duration exceedances and facilitate station to station comparison.

Figure 5.3 Regional Station Flow Duration Curves

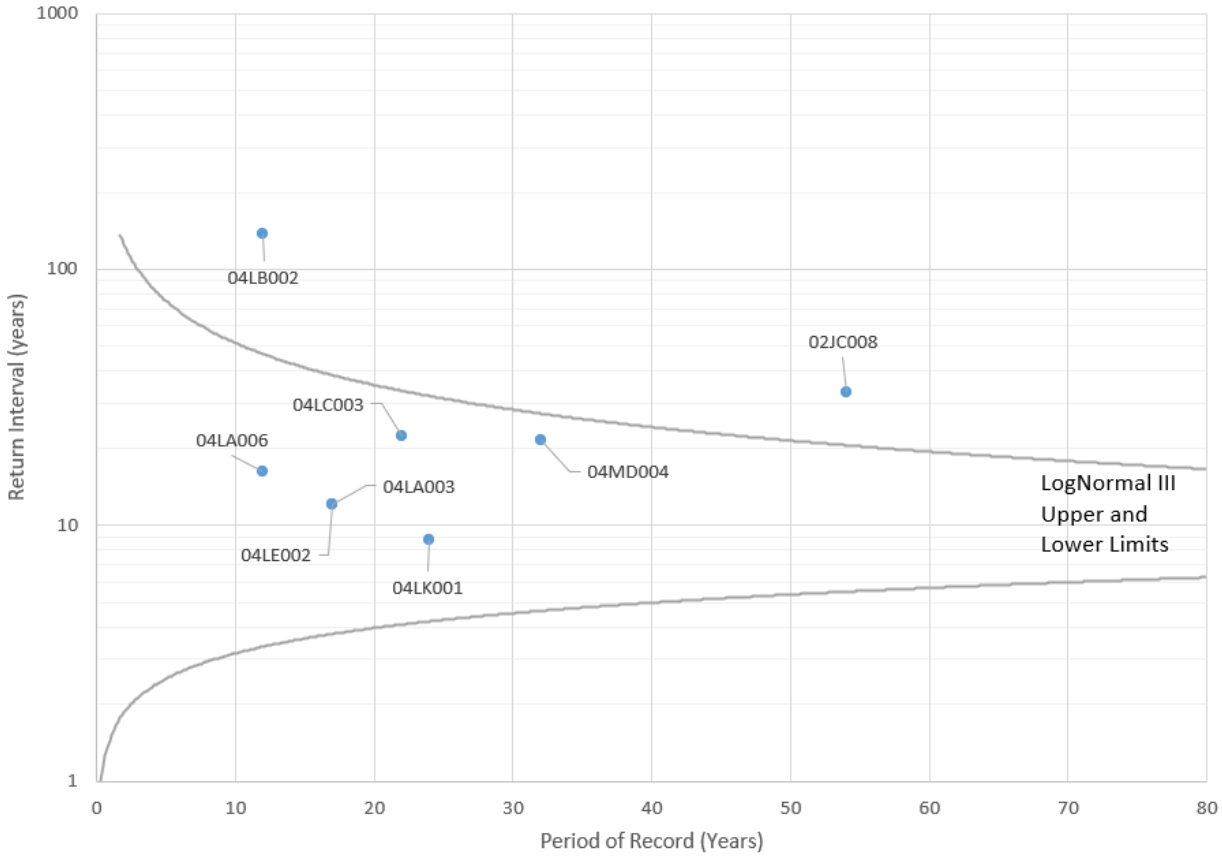


Stations 02JC008, 04LK001, and 04LB002 fell out of alignment with the other regional station's FDCs. Station 04LB002 has the shortest period of record (16 years) which may contribute to its variation. Station 02JC008 has the largest drainage area and the longest period of record (56 years). This station shows variation from most of the station curves in the first half of its curve, which implies fewer peaking flows through this station watershed. Lastly, Station 04LK001 deviates from much of the stations in the later have of its FDC curve. This would indicate much lower flows at this station watershed, or some variation in its dataset. This station has a 13-year gap in its 26-year record data set (1993 to 2006 is missing) which could affect its result. These variations imply that these stations have varying hydrological response behaviour to the others.

5.2.1.1.6 Index Flood

The results of the index flood test are presented in the Figure 5.4. Stations 04LB002 and 02JC008 are outside of the Log-Normal Type III 95% confidence interval.

Figure 5.4 Index Flow Test of the Regional Hydrology Stations



5.2.1.1.7 Regional Station Selection

As described in the homogeneity test results, a number of tests yielded moderate to minor differences among regional hydrometric stations such as with vegetation and land cover and annual precipitation. However, based on the results of the unit flow assessment, FDC curve assessment and index flow assessment, WSC stations 02JC008, 04LK001, and 04LB002 were removed from the regional dataset. The WSC stations used to proceed with the regional assessment are listed in Table 5.10.

Table 5.10 Regional WSC Stations Selected for the Regional Hydrology Assessment

Station ID	Station Name	Drainage Area (km^2)	Years of Record	Record Period	Site Proximity (km)	Climate Normal[1] Prec. (mm)
IVANHOE RIVER AT FOLEYET	04LC003	1640	20	2002- 2023	100 km SW	844
TATACHIKAPIKA RIVER NEAR TIMMINS	04LA003	872	23	2001-2023	52 km S	830
NEMEGOSENDA RIVER NEAR CHAPLEAU	04LE002	432	18	2006-2023	150 km SW	869
PORCUPINE RIVER AT HOYLE	04MD004	408	34	1977-1994; 2007-2022	37 km SE	836
MOLLIE RIVER AT HIGHWAY NO. 144	04LA006	92.5	17	2007-2023	150 km S	828

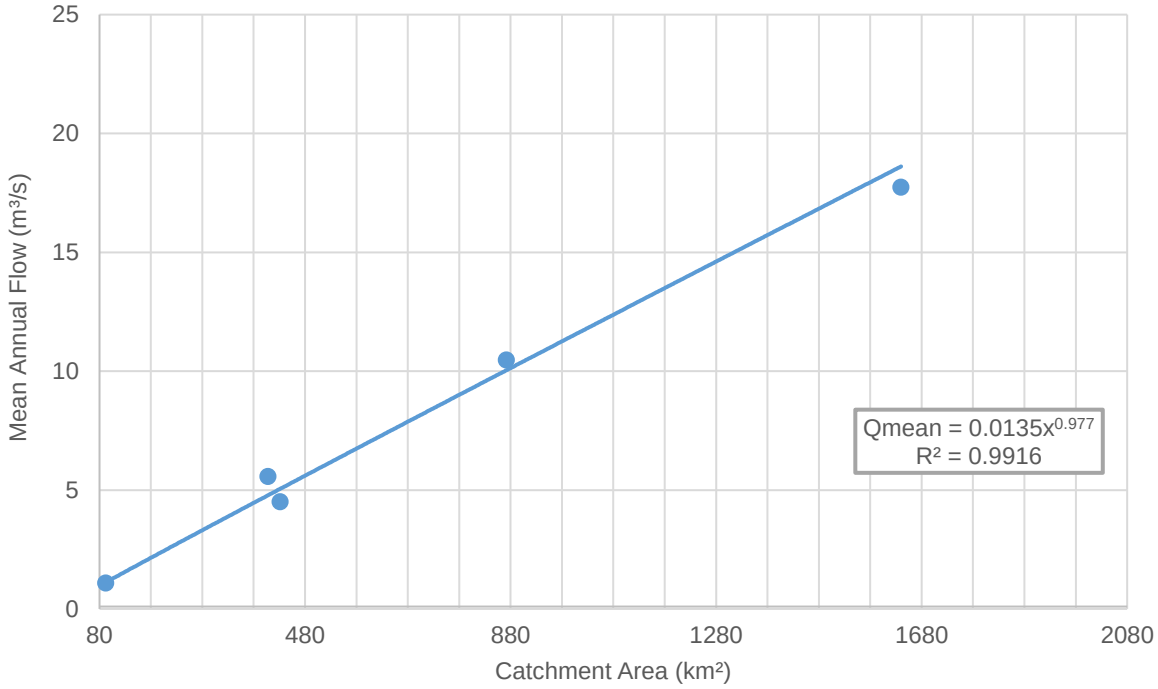
Note:
1 Annual precipitation data from OWIT (MNRF 2023a)

Stations 04LC003 and 04LE002 were flagged as having a greater proportion of disturbance land use type within their watershed (16% and 20% of their land, respectively) through the homogeneity testing. This difference was not enough evidence to support that they varied greatly from other stations as they were in alignment for all other remaining homogeneity tests. As explained in Section 4.1.2, stations are not eliminated because of a failure of a single test, but if it failed multiple tests demonstrating more heterogeneity than homogeneity. These two stations demonstrate a greater degree of homogeneity and are kept within the assessment.

5.2.1.2 Mean Annual Flow

The MAF for the selected five WSC stations were plotted against their catchment areas on a log-log graph (Figure 5.5). The log regression equation between MAFs and catchment areas that comes from this assessment can be applied to the LSA watersheds to estimate MAFs. The R^2 (0.99) between MAF values and catchment areas indicates a good relationship. The same assessment was performed for minimum and maximum annual flows. These graphs can be found within Appendix B.4.

Figure 5.5 Regional Station Relationship Between Mean Annual Flow and Catchment Area



These results are summarized in Table 5.11, including the determination of the runoff coefficient from each of the stations using the unit flows.

Table 5.11 Mean Annual Flow and Runoff Coefficient Summary

Station Name	Station ID	Drainage Area (km^2)	Mean Annual Flow (m^3/s)	Unit Flow ($m^3/s/km^2$)	Runoff Coefficient (-)
IVANHOE RIVER AT FOLEYET	04LC003	1640	17.7	0.011	0.40
TATACHIKAPIKA RIVER NEAR TIMMINS	04LA003	872	10.5	0.012	0.46
NEMEGOSENDA RIVER NEAR CHAPLEAU	04LE002	432	4.5	0.010	0.38
PORCUPINE RIVER AT HOYLE	04MD004	408	5.6	0.014	0.51
MOLLIE RIVER AT HIGHWAY NO. 144	04LA006	92.5	1.1	0.012	0.45

5.2.1.3 Mean Monthly Flows

The mean monthly flows for each of the five selected stations are presented in Figure 5.6. The minimum monthly flows and maximum monthly flow graphs are found in Appendix B.4.

Figure 5.6 Regional Station Mean Monthly Flows

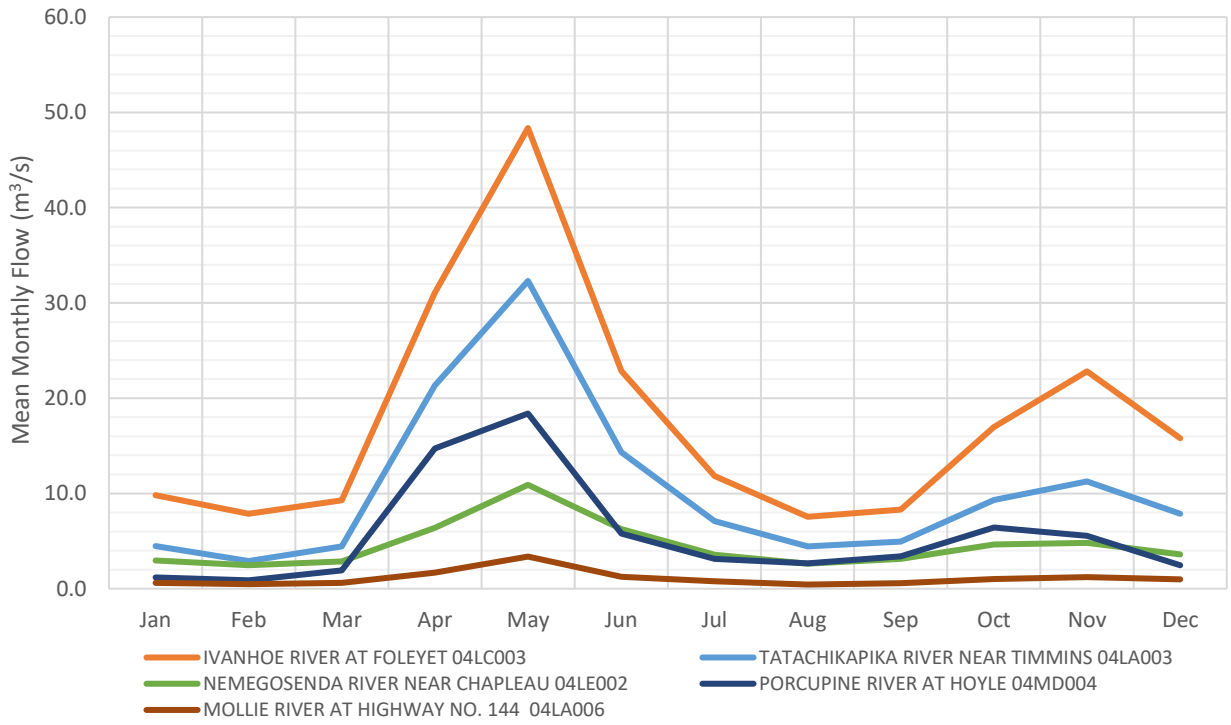


Figure 5.6 and Figure A.7 to A.9 in Appendix A help to characterize the behaviour of stream flow in each of the regional watersheds. Each of the figures describe two major peaks within any year. The first peak occurs in May due to spring freshet and the second in November due to fall rainfall. Typically, flows are reduced in winter months (January – February) and in late summer (July to September) (Figure 5.6). Flows are reduced in July – September despite elevated monthly precipitation amounts due to the water abstraction effects of evapotranspiration (ET) and increased infiltration capacity during that period.

On a log-log graph, the mean flows by station are plotted against their catchment area to elicit individual monthly regression relationships of flows. The R^2 of the relationships between each month's mean flow and catchment areas ranges between 0.90 and 1, with a mean of 0.97. Overall, this indicates a good fit of the regression to the regional stations. Appendix B.4 presents the relationships between mean monthly flows and catchment area, as well as the coefficient of determination results.

5.2.1.4 Baseflows

Baseflow separation was conducted for historical flows at the selected regional WSC stations using the Lyne and Holick Method using an alpha value of 0.999, described in Section 4.1.2. The results of baseflow separation for the regional stations are presented in Table 5.12.

Table 5.12 Regional Station Baseflow Separation Results[1]

Station ID	Drainage Area (km^2)	Period of Record	Winter	Spring	Summer	Fall	Annual Baseflow Ratio (BFI)	Baseflow Discharge Rate per Unit Area ($m^3/s/km^2$)
04LC003	1640	2001-2022	0.56	0.19	0.54	0.23	0.29	0.0032
04LA003	872	2005-2021	0.55	0.14	0.49	0.24	0.24	0.0037
04LE002	432	2006-2021	0.68	0.30	0.64	0.48	0.47	0.0054
04MD004	408	1977-2021	0.58	0.10	0.29	0.20	0.18	0.0024
04LA006	92.5	2008-2021	0.59	0.19	0.56	0.27	0.31	0.0029
Total Averages			**0.59**	**0.18**	**0.50**	**0.28**	**0.30**	**0.0035**

Note:
1 Proportion of total streamflow derived from baseflow

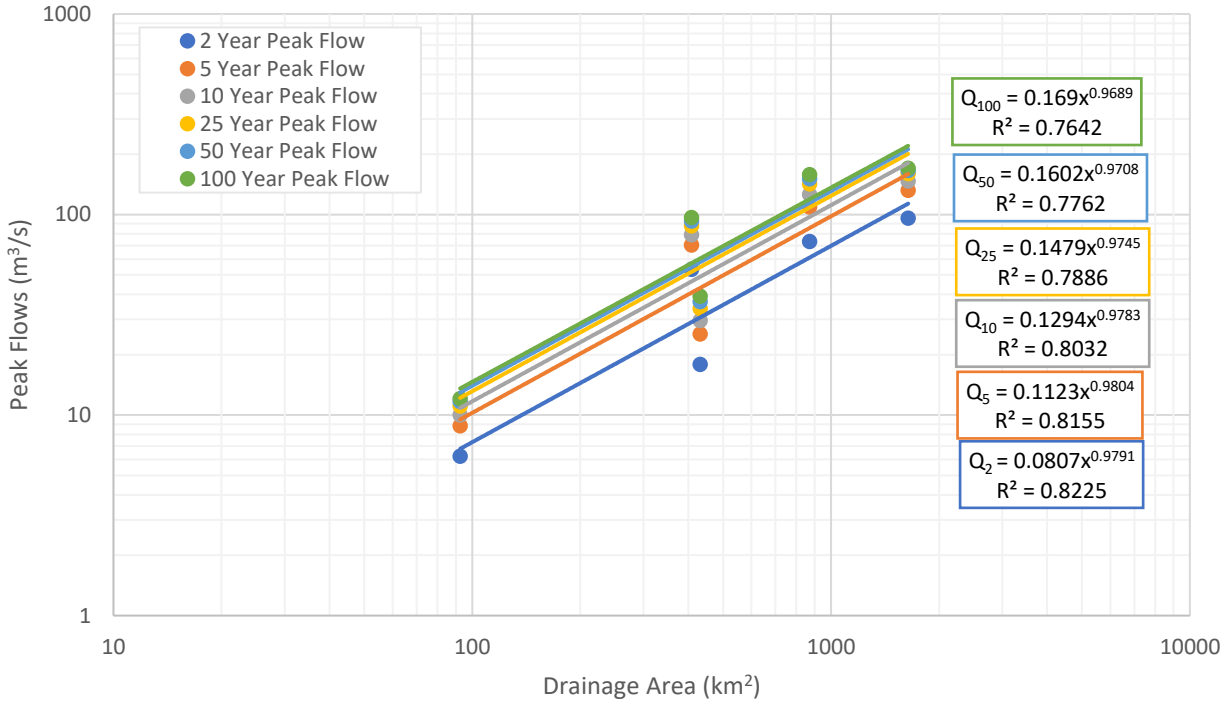
The BFI value describes the proportional contribution of baseflow primarily derived from groundwater discharge and watershed storage, such as lake and wetland storage and flow attenuation to total streamflow. In the winter, the BFI ratio is at its highest, which is expected during these months. In the spring and fall, the impacts of baseflow to streamflow are decreased due to greater amounts of runoff from precipitation and snowmelt events. On average, the annual BFI ratio is 0.30 which implies overall importance of groundwater discharge as well as lake and wetland attenuation to total streamflow. The regional average discharge per area of baseflow (0.0035 $m^3/s/km$) is used as an input for the hydrological model, described in Section 4.1.4.2.7.

5.2.1.5 Flood Flows

Flood frequency peak flows are computed for various return periods using the single highest flow event (in most cases instantaneous flow) from each year of record for each selected WSC station and then conducting a statistical assessment of these values. Probability distributions were compared first to determine which would best fit the data to define the design flows of various return periods. A single station frequency analysis method with a Log-Pearson Type III distribution was used to estimate 2, 5, 10, 100-year return periods was used in this study.

Figure 5.7 presents the relationships between peak flows and catchment areas for the examined return periods.

Figure 5.7 Regional Assessment Peak Flood Flows Regression

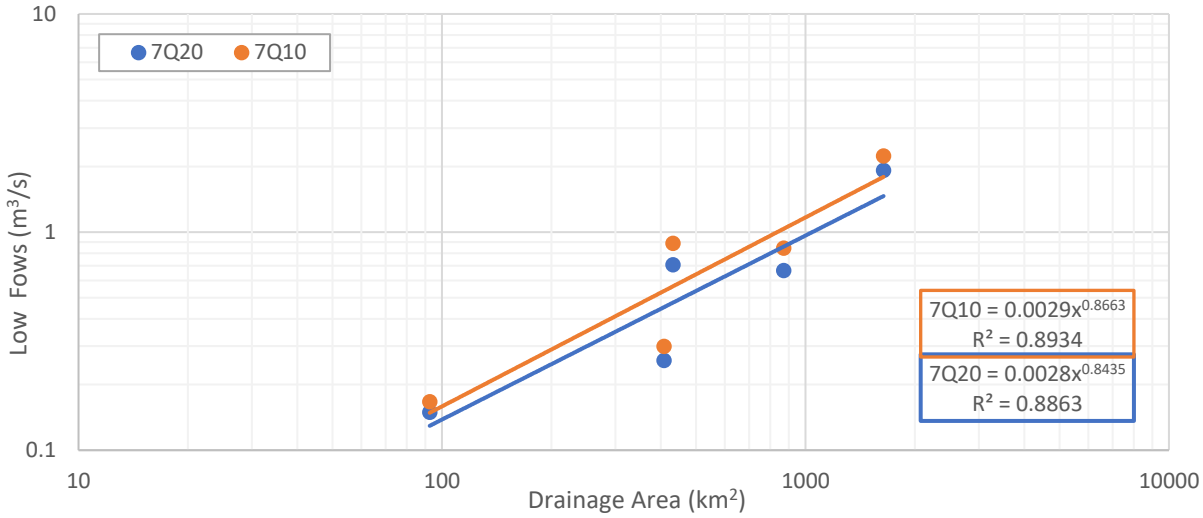


The R^2 values of the developed regression relationships between the peak flows and catchment areas ranges from 0.76 to 0.82, indicating a good level of confidence for each return period. The R^2 values tend to decrease as return periods increase, providing some indication that there is a trend of variance between each of the regional stations in terms of their recorded peak floods. This could be a result of varying record lengths and difference in local precipitation events.

5.2.1.6 Low and Environmental Flows

The 7Q10 (7-day average low flow with a 10-year return period) and 7Q20 (7-day average low flow with a 20-year return period) are indicators of extended low water conditions. The 7Q10 and 7Q20 low flows are plotted against catchment area, presented in Figure 5.8 for the selected regional WSC stations. Single low flow indices were derived using a regional frequency analysis for the selected WSC stations.

Figure 5.8 Regional Low Flows and Catchment Area Regression



A summary of the environmental flows determined through the Tessman Method (Section 4.1.2) is provided below in Table 5.13. Another important environmental flow threshold includes 10% of instantaneous or daily flows and 30% of the mean annual discharge as indicated in Section 4.1.2 (DFO 2013). The 30% of mean annual discharge is derived from the regression equation for mean annual flow in Section 5.2.1.2 and is presented in Table 5.14.

Table 5.13 Regional Station Environmental Flows Calculated Following the Tessman Method

	Environmental Flows (m^3/s)				
	04LC003	**04LA003**	**04LE002**	**04MD004**	**04LA006**
Drainage Area (km^2)	**1640**	**872**	**432**	**408**	**92.5**
January	7.10	4.19	1.80	2.16	0.44

Table 5.14 Summary of Project Site Mean Annual Flows and 30% of Mean Annual Flows

Watershed	Station	Drainage Area (km^2)	MAF (m^3/s)	30% MAF (m^3/s)
Jocko Creek	SW-8	92.5	1.13	0.338
North Driftwood	SW-2b	105.5	1.28	0.384
West Buskegau	SW-6b	199.0	2.38	0.714

5.2.2 Environmental Water Balance

An environmental water balance was created using the Thornthwaite Monthly Water Balance model developed by the USGS (2007), as described in Section 4.1.2.

The model was run for three input data scenarios: Climate normal (1991-2020), driest year (2012), and wettest year (1961). The model was run on a monthly time step using one year of monthly total precipitation and average temperature data from the applicable ECCC climate station for each scenario, following two years of climate normal data to act as the warm-up period for the model. Other model inputs, such as latitude and infiltration capacity, are presented in Table 5.15. Input values were based on local conditions, professional judgment and values suggested in McCabe and Wolock (1999), and USGS (2007).

Table 5.15 Environmental Water Balance Inputs

Input Parameters	Values
Runoff Factor	0.65
Direct Runoff Factor	0.05
Soil Moisture Storage Capacity (mm)	331
Latitude of Location (Degree)	49
Rain Temperature Threshold (Degree Celsius)	0.0
Snow Temperature Threshold (Degree Celsius)	0.0
Maximum Melt Rate	0.5

The infiltration factor was calculated following MOE procedures (2003) and used for the determination of groundwater recharge values. The infiltration factor Project Site area was calculated as 0.35 based on a topographical factor of 0.1 for land with a topographic slope of 1.7%, a soil factor of 0.1 for clay soils, and a cover factor for 0.15 representing a blend of woodland and cropland type covers, represented by wetland type vegetation. The runoff factor would then be 0.65, as presented in Table 5.15. The following tables summarize outputs form the Thornthwaite Monthly Water Balance model for all three climatic conditions (Table 5.16 to Table 5.18).

Table 5.16 Environmental Water Balance for the Climate Normal Period from 1991 to 2020

Under the 1991 – 2020 climate normal period, actual evapotranspiration is modelled to account for 473.4 mm based on the monthly temperature and precipitation, soil storage, and land cover type. Statistics Canada (2017) estimated actual evapotranspiration rate for the Project site area is in the 400 mm to less than 500 mm range with a 1 km resolution dataset, which is comparable to the climate normal water balance result (Table 5.16). This provides independent verification for the modelled actual evapotranspiration amount.

The 1991- 2020 climate normal total stream flow estimate of 328.2 mm represents a streamflow (runoff) coefficient of 41%. The average regional gauging station value for the runoff coefficient is 44% (ranges from 38% to 51%), which is comparable to the environmental water balance result (Table 5.11). The 1991-2020 climate normal total groundwater recharge (infiltration) estimated for the project site is 114.9 mm/year, which is 35% of the total streamflow amount (Table 5.16). This is comparable to the determined baseflow index of 0.30 presented in Table 5.12.

5.2.3 Local Hydrology

5.2.3.1 Hydrometric Monitoring Results

Data collected by the local hydrometric monitoring program was utilized for the generation of station specific rating curves and hydrographs. These results provide a quantitative measure of the hydrological nature of the Project study area.

Following the end of the 2023 data collection period, station hydrometric summaries, rating curves, and hydrographs were compiled and are presented in Appendix B.2. Table 5.19 summarizes the results of the final rating curves developed for each station.

Table 5.19 Rating Curve Results Summary

Watershed	Station	Equation[1,3]	R^2	Data Points
Jocko Creek	SW-7	$X = 0.6227\ (Y)^{3.723}$	0.96	7
	SW-8	$X = 0.4051(Y)^{3.2593}$	0.90	7
North Driftwood	SW-1	N/A[2]	N/A	9
	SW-2b	$X = 1.7922\ (Y)^{2.428}$	0.99	7
	SW-3	N/A[2]	N/A	8
	SW-9	$X = 9.740\ (Y)^{8.201}$	0.92	4
West Buskegau	SW-4	$X = 0.420\ (Y)^{2.307}$	0.50	5
	SW-5	$X = 6.259\ (Y - 0.5)^{1.343}$	0.99	8
	SW-6b	$X = 5.937\ (Y - 0.6)^{1.110}$	0.98	7

Notes:
1 X = Discharge (m^3/s) and Y = Thalweg Depth (m)
2 SW-1 and SW-3 have no presented rating curve equation due to reduced data quality - no relationship found.
3 The Rating Curve equations are applicable to ice-free periods alone.

Within Table 5.19, the total number of data points used in the generation of the station specific rating curve may be less than those reported to have been collected, presented in Table 4.13, due to parsing of data used in the rating curve generation. Data points could be parsed for a number of reasons, including measurement under ice conditions which are not applicable for the generation of ice-free rating curves, presence of extreme outliers that may indicate a low- quality measurement result, or due to a high level of uncertainty in the data results due to field measurement errors or beaver dam effects. Thalweg depth, or maximum water depth, was used for the development of the rating curves as surface water elevation recordings had not been collected during each measurement. Using thalweg depth as the basis for the rating curves allowed for the inclusion of more of the available data points. Station specific rating curves and hydrographs are presented in Appendix B.2. Although coefficient of determination values of the rating curves are generally high, all stations require further field flow measurements at a wider range of flow depths to improve the statistical integrity of the stage-discharge relationships.

5.2.3.1.1 Jocko Creek

SW-7

SW-7 is one of the two stations located within the Jocko Creek watershed (Figure A.2, Appendix A). This station is located upstream of a large culvert crossing under Highway 655. This station has recorded in total seven flow measurements over the course of the study period, with one ice cover flow measurement point. The channel crossing is approximately 13.5 m wide and 3.03 m deep at bankfull. Directly downstream from the channel crossing, a box culvert bypassing Highway 655 exists and is 4.2 m wide (Appendix B.2). Upstream from the crossing, the channel is naturalized and surrounded by forest. The crossing itself has a rocky bottom with gravels and cobbles making up the channel bed. The stilling well with the Levelogger® was setup at the measuring cross-section.

SW-8

SW-8 is the second Jocko Creek watershed station and is located further downstream from SW-7 (Figure A.2, Appendix A). A total of six measurements were recorded from SW-8 (none during ice conditions). Downstream of the station exists a bridge passage, and the upstream condition of the channel is naturalized, straight, with forest cover on either of the banks. The channel bed is primarily comprised of soft soils with the Levelogger® setup at the cross-section for flow data collection. The channel is approximately 14.4 m wide and 2.81 m deep at bankfull.

The rating curve from SW-8 is the most downstream rating curve, and thus it is used to represent the Jocko Creek watershed (Figure 5.9). Bankfull depth has been reported to be at 2.81 m, therefore for flows extending beyond this depth contain some uncertainty. The hydrograph from this station is generated from the associated rating curve equation. An event specific hydrograph is presented in Figure 5.10. Uncertainty exists in the hydrograph above flows which have not been captured yet by field data measurements (above 10 m^3/s).

Figure 5.9 SW-8 Open Water Rating Curve - Jocko Creek

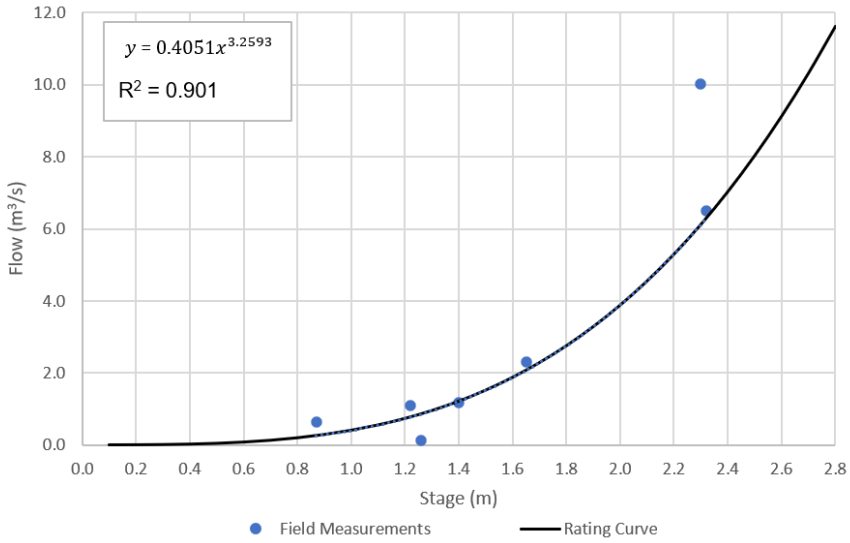

Figure 5.10 SW-8 Event Specific Hydrograph - Jocko Creek

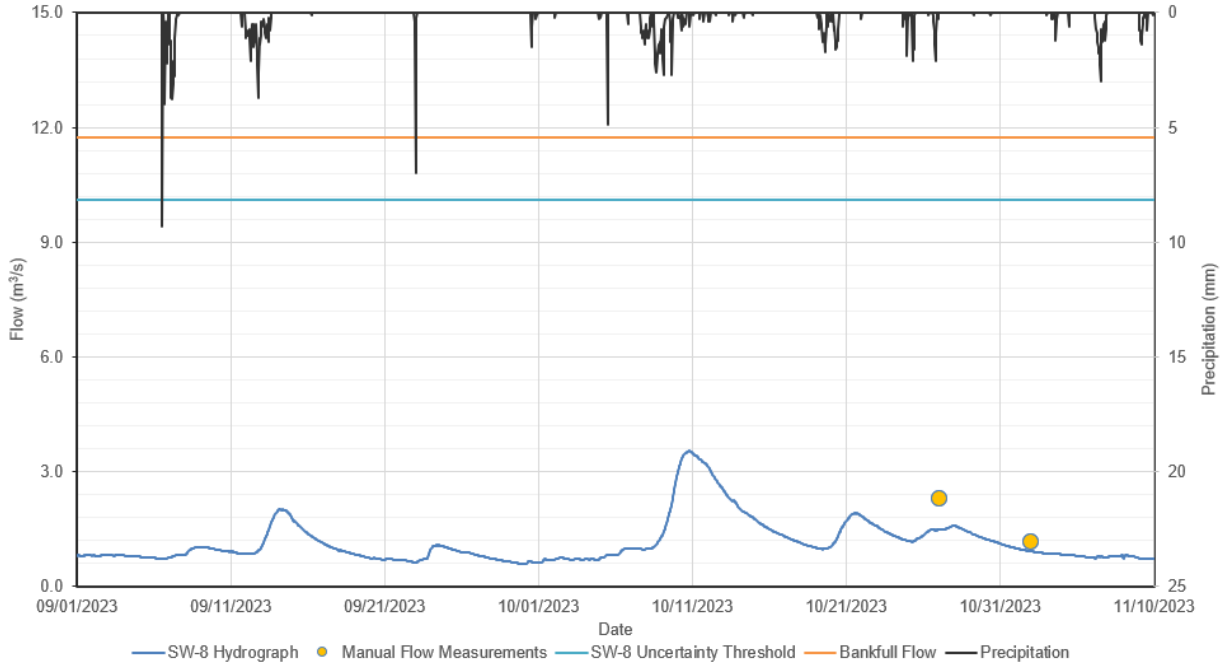

The rising limb of the hydrograph reaches peak flow conditions within 36 to 70 hours following a precipitation event with a relatively steep rising limb. The falling limb of the hydrograph typically takes between 200 hours and 210 hours to return to baseflow conditions following a rainfall event.

5.2.3.1.2 North Driftwood

SW-1

SW-1 is hydrometric station located at a corrugated steel pipe (CSP) culvert on a tributary in the North Driftwood River watershed (Figure A.2, Appendix A). Upstream of the culvert, a large, ponded area surrounded by dense vegetation, grasses, and trees is found. Downstream of the culvert, the tributary confluences with the North Driftwood River, and the channel bed is gravelly with some soft bed material. Flow was monitored at the culvert outlet and the stilling well with Levelogger® was setup near the culvert inlet.

Throughout the course of the hydrometric study period, debris and mud were observed at the culvert inlet resulting in a periodic blockage of the culvert. Due to periodic flow constraint, a rating curve or culvert flow equation could not be developed to estimate continuous flows for ice-cover and ice-free conditions (Appendix B.2).

SW-2b

SW-2b is the most downstream station located on the North Driftwood River, located downriver from a bridge (Figure A.2, Appendix A). The stilling well with Levelogger® was setup at the upstream side of the bridge near the cross-section. The cross section is approximately 13.5 m wide, 1.62 m deep at bankfull, and has a channel bottom that is gravelly with cobbles.

The rating curve representing the North Driftwood watershed has reduced confidence when flows are greater than 2.5 m^3/s due to lack of field measurements above this discharge (Figure 5.11). The hydrograph from this station is generated from the related rating curve equation (Figure 5.12).

Figure 5.11 SW-2b Rating Curve - North Driftwood

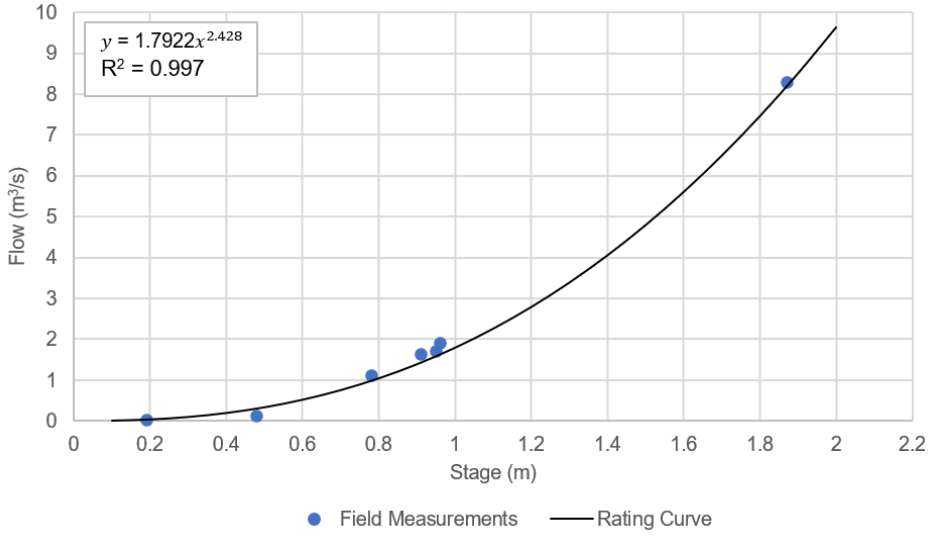

Figure 5.12 SW-2b Event Specific Hydrograph - North Driftwood

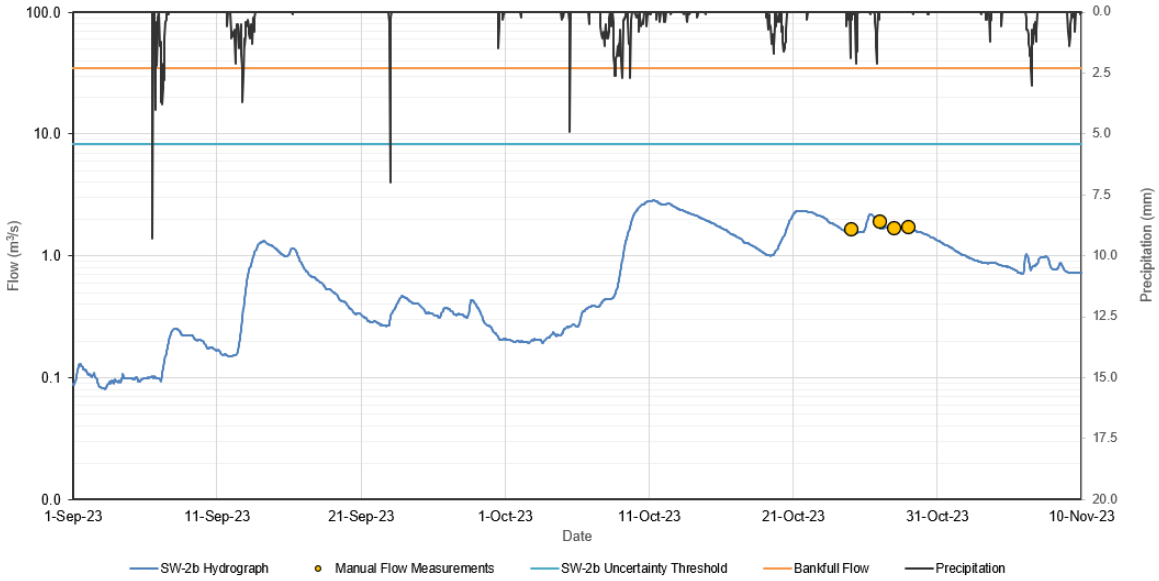


The rising limb of the hydrograph reaches peak flow conditions within 19 to 41 hours following a precipitation event with a relatively steep rising limb. The falling limb of the hydrograph typically takes between 170 hours to 211 hours to return to baseflow conditions following a rainfall event. This hydrograph is similar to that of the SW-8 hydrograph representing Jocko Creek. Lag time to peak flows from a rainfall event are somewhat quicker at SW-2b, but the length of the falling limb is rather similar (Figure 5.10 and Figure 5.12).

SW-3

SW-3 is station located within a wetland area of the site at the upstream end of the North Driftwood River watershed (Figure A.2, Appendix A). This station is often flooded, with very saturated soils making the channel bed unstable. The channel is approximately 4.75 m wide and has a bankfull depth of 0.78 m. Upstream and downstream from the cross section, the channel is braided, with dense grasses and vegetation at either of the banks. The stilling well with the Levelogger® was setup at the cross section of the flow measurement.

Beaver dam activity was observed to cause a backwatering effect through the 2021 to 2022 monitoring period. A rating curve relationship was not able to be generated for this station due to reduced confidence of field data (Appendix B.2).

SW-9

SW-9 is on the North Driftwood River and is located at the outlet of Martin Lake (Figure A.2, Appendix A). This station is a grouping of three culverts totalled together for flow measurements. Upstream from the culverts, the ponded tributary confluences with the North Driftwood River main channel. The stilling well with the Levelogger® was setup at the cross section of the flow measurement.

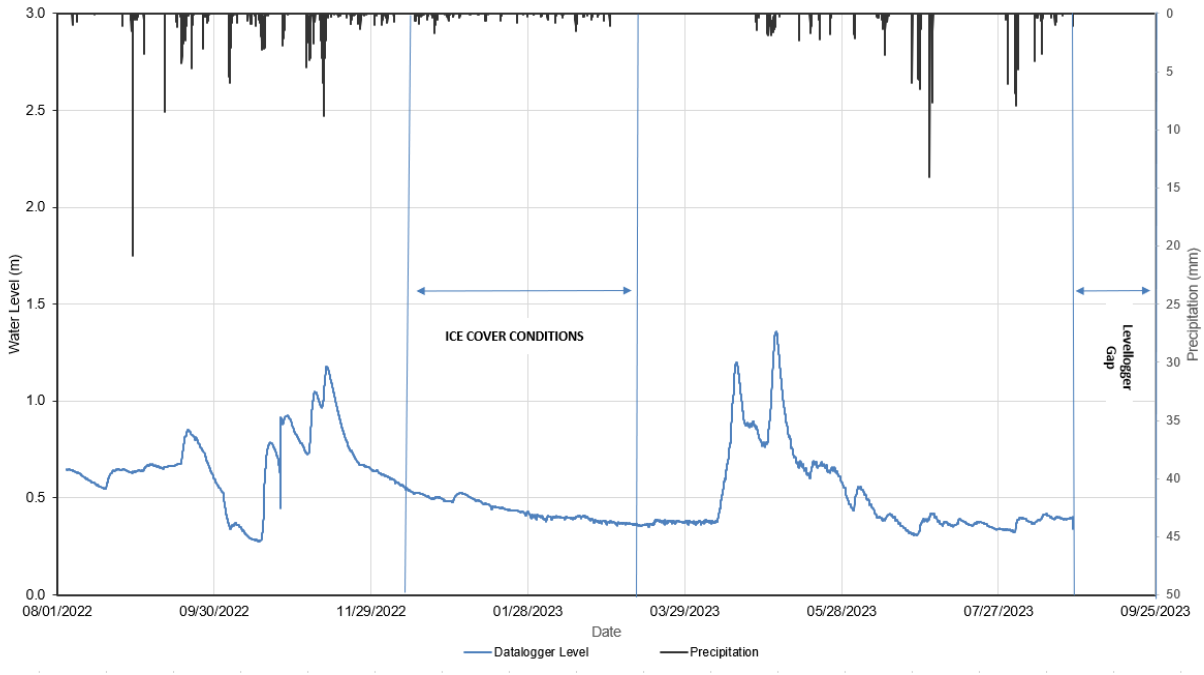
Beaver dams were blocking the culverts for the beginning period of the hydrometric monitoring study but were cleared in October 2022. Four of the gathered data points from 2023 were used for the generation of the rating curve due to reduced data confidence of data collected in 2022 (Appendix B.).

5.2.3.1.3 Lakes Monitoring

SW-10

SW-10 is a lake level monitoring station, monitoring the water level of Martin Lake, located within the North Driftwood River watershed (Appendix B.2). Continuous water level data was recorded at 30-minute intervals using the Levelogger® stilling well setup at the site. Using local barometric pressure data, daily water depths at the lake station were calculated. The continuous water level graph is provided in Figure 5.13.

Figure 5.13 SW-10 Martin Lake Continuous Level Graph

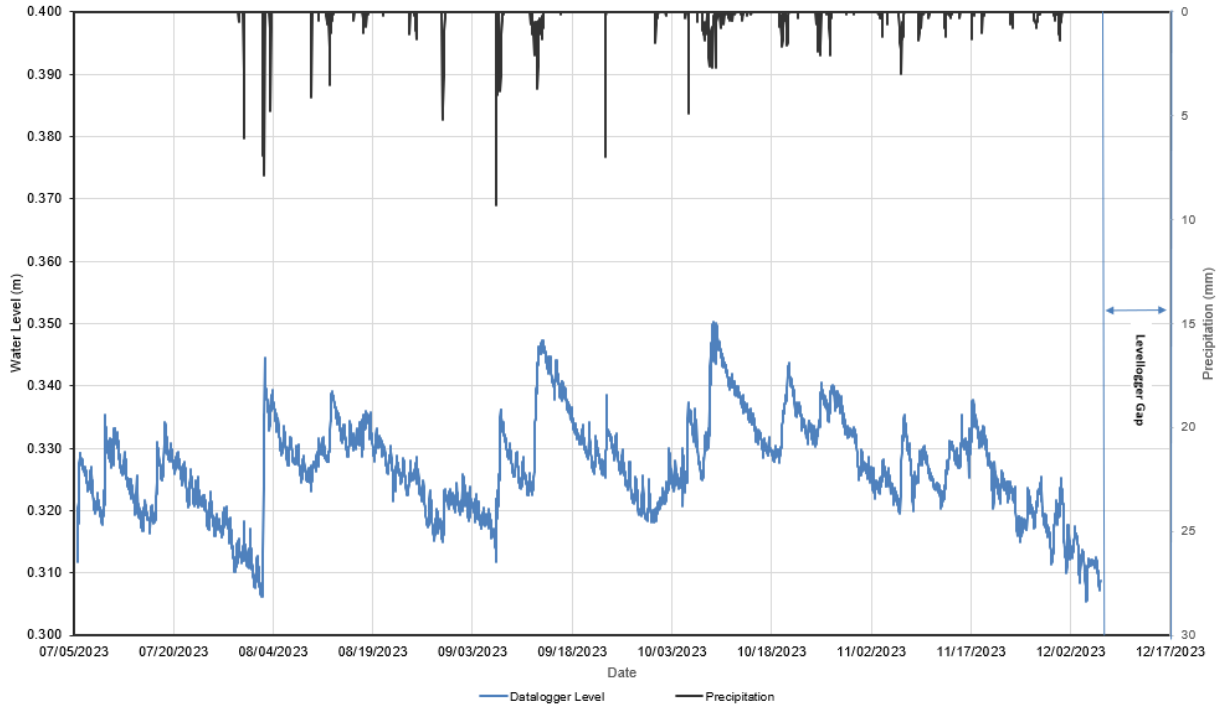


The existing record of lake level data at the Martin Lake Station covers over one year of data. Martin Lake has a mean depth of 3.4 m with a maximum depth of 11 m, identified by the bathymetric assessment provided in Section 5.2.3.3 with bathymetric mapping provided in Appendix A. Lake level has been recorded to fluctuate between a minimum of 0.28 m, recorded on October 17, 2022, and a maximum of 1.36 m occurring on May 3, 2023. Temperature and dissolved oxygen measurements lake profiling have been collected at Martin Lake and are presented in Section 5.3.2.1.1.

SuthLk

SuthLk is the lake level monitoring stations installed at Sutherland Lake, located within the North Driftwood River watershed (Appendix B.2). Continuous water level data was recorded at 30-minute intervals using the Levelogger® stilling well setup at the site. Using local barometric pressure data, daily water depths at the lake station were calculated. The continuous water level graph is provided in Figure 5.14.

Figure 5.14 Sutherland Lake Continuous Level Graph



The existing record of lake level data at the Sutherland Lake Station covers less than half a year of data at the end of 2023. Sutherland Lake has a mean depth of 4.1 m with a maximum depth of 22 m, identified by the bathymetric assessment provided in Section 5.2.3.3 with bathymetric mapping provided in Appendix A. Lake level has been recorded to fluctuate between a minimum of 0.305 m, recorded on December 4, 2023, and a maximum of 0.350 m occurring on October 9, 2023. Due to the minimal record available at Sutherland Lake, it is likely that the full range of typical water levels at this lake have not been captured. Temperature and dissolved oxygen measurements lake profiling have been collected at Sutherland Lake and are presented in Section 5.3.2.1.1.

5.2.3.1.4 West Buskegau

SW-4

SW-4 is one of the stations located within the West Buskegau watershed located along Prosser Creek (Figure A.2, Appendix A). Similar to SW-3, it is a station located within a wetland area of the site, with saturated soils creating an unstable channel bed. The channel itself is approximately 11.5 m wide 1.2 m deep at the crossing to bankfull. Both upstream and downstream ends of the channel are surrounded by dense vegetation, grasses, and forest cover. The stilling well with the Levelogger® was setup at the cross section of the flow measurement. A total of nine measurements were collected from SW-4, with one being under ice conditions. Hydrometric station summary sheet along with station hydrographs are provided in Appendix B.2.

SW-5

SW-5 is a station located towards the downstream end of the West Buskegau watershed (Figure A.2, Appendix A). The channel is straight with a soft soil material making up the channel bed. Both the upstream and downstream ends from the cross-section are surrounded by tree cover and vegetation. A cross section survey is yet to be completed to determine the bank full depth and channel width. The stilling well with the Levelogger® was setup at the cross section of the flow measurement along the right bank of the channel. This site has a total of 10 recorded flow measurements, one taken under ice conditions.

SW-6b

SW-6b is the most downstream station of the West Buskegau watershed (Figure A.2, Appendix A). It is located further downstream in the watershed than SW-5. The channel is straight with a soft soil material making up the channel bed. The channel is nearly 17.2 m wide and 1.81 m deep at bankfull. the upstream and downstream ends from the cross-section are surrounded by tree cover and vegetation. A total of nine measurements were collected at this site over the course of the hydrometric monitoring program, with only one ice cover measurement taken.

The SW-6b rating curve representing the West Buskegau watershed has reduced confidence for when flows are greater than 6.0 m^3/s (Figure 5.15). The hydrograph from this station is generated from the related rating curve equation (Figure 5.16).

Figure 5.15 SW-6b Rating Curve - West Buskegau

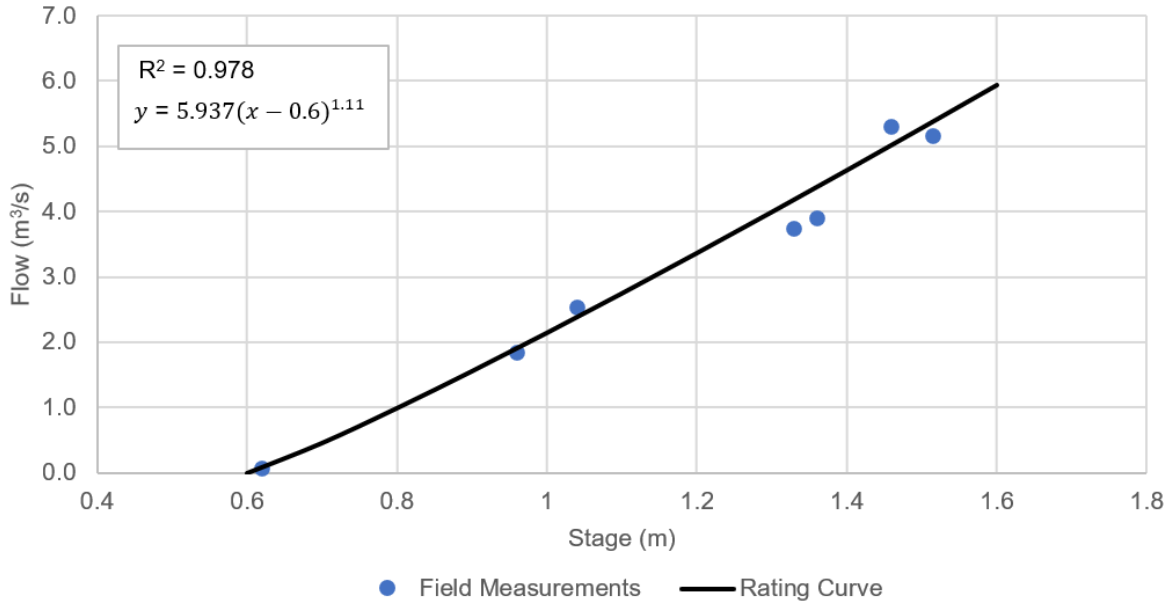


Figure 5.16 SW-6b Event Specific Hydrograph - West Buskegau

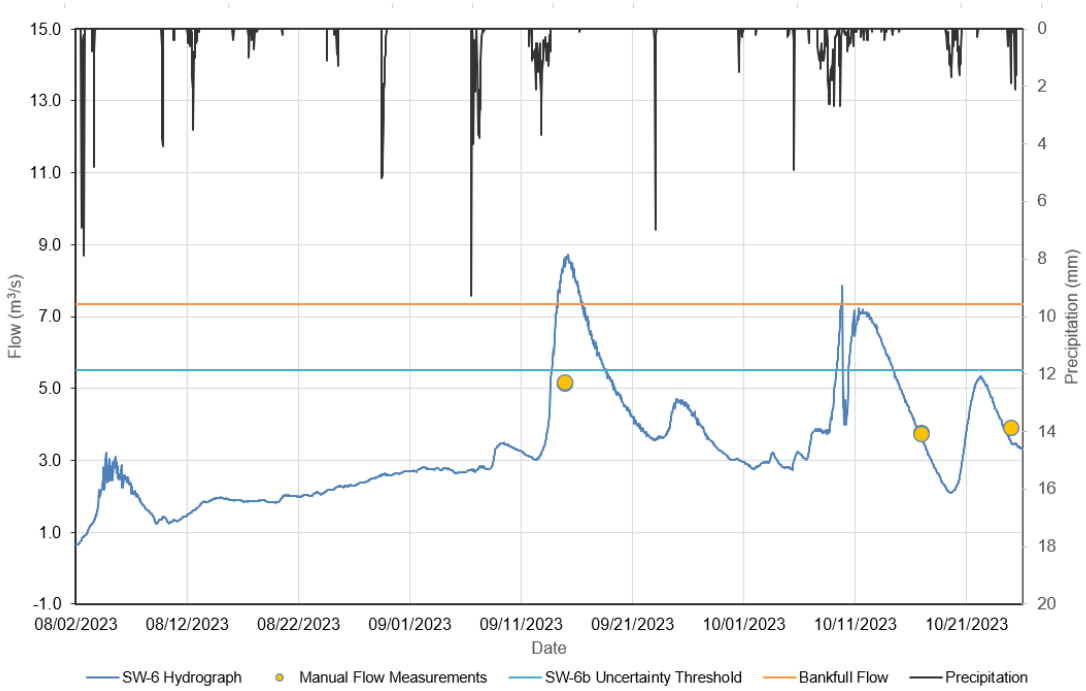

The rising limb of the hydrograph reaches peak flow conditions within 48 to 102 hours following a precipitation event with a relatively steep rising limb. The falling limb of the hydrograph typically takes between 189 hours to 200 hours to return to baseflow conditions following a rainfall event. This station has the longest time to peak following a rainfall event, with comparable falling limb times to the previously presented hydrographs (Figure 5.10 and Figure 5.12). The West Buskegau is the largest of the watersheds and SW-6b has the largest drainage area of the hydrometric monitoring stations (Table 4.13). The slope of the West Buskegau channel is the lowest of the three watersheds at 0.05% with North Driftwood at 0.08% and Jocko Creek at 0.11% according to OWIT (MNRF 2023a). The lower channel slope would contribute to the longer time to peak within the watershed.

5.2.3.2 Ice Cover

As part of hydrometric flow monitoring, manual measurements of watercourse ice thickness were taken. Table 5.20 presents the recorded ice thicknesses within the area of the Project.

Table 5.20 Ice Thickness Measurement Summary

Year	Watershed	Station	Date	Recorded Ice Thickness (m)
2022	North Driftwood	SW-3	2-Feb-22	0.33
	West Buskegau	SW-5	2-Feb-22	0.56
2023	Jocko Creek	SW-7	23-Feb-23	0.48
		SW-7	1-Mar-23	0.48
		SW-8	27-Feb-23	0.04
		SW-8	24-Mar-23	0.03
	North Driftwood	SW-1	23-Feb-23	0.51
		SW-2b	28-Feb-23	0.47
		SW-9	27-Feb-23	0.33
		SW-10	27-Feb-23	0.43
	West Buskegau	SW-6b	28-Feb-23	0.45

In general, ice thickness varies throughout the surface water quality stations. Stations recorded ice thicknesses ranging from 0.33 m to 0.56 m in February 2022 and 2023 and March 2023. Only station SW-8 has recorded minimal ice thickness of between 0.03 and 0.04 m at the Jocko Creek study watershed in February and March 2023, respectively. SW-8 is a station located across a stretch of the Jocko Creek directly downstream from a bridge, where flow is typically very deep (0.87 to 2.3 m on record). Ice depth may not have developed due to surface water turbulence caused by the upstream bridge.

Martin Lake (SW-10) has one recorded ice thickness recording from February 27th 2023. Ice depth was recorded to be 0.43 m during this site visit.

5.2.3.3 Bathymetry

A bathymetric assessment of specific site lakes was performed, with mapping provided in Figures A.10 to A.18, Appendix A. The results are presented in Table 5.21.

Table 5.21 Bathymetry Results of Select Study Area Lakes

Watershed	Name	0 m Elevation (masl)	Mean Depth (m)	Maximum Depth (m)	Surface Area (ha)
North Driftwood	Unnamed Lake – LG Stockpile West	270.19	2.5	11.0	5.02
	Martin Lake	268.29	3.4	11.0	19.98
	Gerry Lake	268.28	6.2	21.0	14.29
	Jack Lake	274.07	4.5	18.0	5.34
	Sutherland Lake	274.68	4.1	22.0	7.95
	Mel Lake	274.86	7.3	21.0	2.73
Jocko Creek	Zed Lake	282.53	4.0	13.0	4.56
	Unnamed Lake – South of Zed Lake	278.58	7.9	13.0	4.10

The bathymetry data are relative to normal fall water levels and are not tied to a benchmark. Additional bathymetry data is presented in the 2021-2023 Fish and Fish Habitat Baseline (Appendix B.8.2 of the Impact Statement) and the Fish and Fish Habitat Supplemental Baseline Report (Appendix B.8.1 of the Impact Statement)).

5.2.3.4 Local Hydrology Assessment

Local site subwatersheds are defined by the hydrometric monitoring station locations (Table 4.13) within each major watershed. Application of the equations determined through the regional assessment is executed in order to quantify annual flows, low flows, and flood flows. These results are presented in Table 5.22.

Table 5.22 Application of Regional Regression Relationships for Annual Flows, Low Flows, and Flood Flows to Local Sites

Watershed	Station	Drainage Area (km2)	Mean Annual Flow (m3/s)	Minimum Annual Flow (m3/s)	Maximum Annual Flow (m3/s)	Low Flow (m3/s)		Flood Flows (m3/s)	
						7Q10	7Q20	25-year	100-year
Jocko Creek	SW-7	72.3	0.88	0.46	1.28	0.12	0.10	9.59	10.70
	SW-8	92.5	1.13	0.58	1.63	0.15	0.13	12.19	13.58
North Driftwood	SW-1	7.2	0.09	0.06	0.14	0.02	0.01	1.01	1.14
	SW-2b	105.5	1.28	0.65	1.85	0.16	0.14	13.86	15.42

Watershed	Station	Drainage Area (km2)	Mean Annual Flow (m3/s)	Minimum Annual Flow (m3/s)	Maximum Annual Flow (m3/s)	Low Flow (m3/s)		Flood Flows (m3/s)	
						7Q10	7Q20	25-year	100-year
	SW-3	14.3	0.18	0.10	0.26	0.03	0.03	1.98	2.22
	SW-9	12.3	0.16	0.09	0.23	0.03	0.02	1.71	1.92
West Buskegau	SW-4	13.6	0.17	0.10	0.25	0.03	0.03	1.88	2.12
	SW-5	154.5	1.86	0.92	2.68	0.23	0.20	20.09	22.32
	SW-6b	199.0	2.38	1.17	3.43	0.28	0.24	25.72	28.53
Note: SW-8, SW-2b, and SW-6b are the most downstream stations of their respective watersheds									

Mean monthly regression relationships developed through the regional hydrology assessment and an environmental flows assessment using the Tessman Methods were applied to the subwatersheds of the site as defined by the monitoring stations. The mean monthly equations applied for the assessment are provided in Appendix B.4, Table B4.2. The results of the application of the Tessman methods and the mean monthly regression equations are provided in Appendix B.4, Table B4.2 and Table B4.3, respectively. This assessment confirmed that environmental flows are maintained at the site. Mean monthly flow values are greater than the environmental flow values for all local site stations at each month.

5.2.4 Hydrologic Model Results

Model calibration is performed to set up the model to match historical recorded flows. As described in Section 4.1.4.3, the Porcupine River HYDAT station was used to estimate flow at the most downstream outlet of each watershed using the DARM method. The determination of model parameters, presented under Section 4.1.4.2, were determined by the calibration process of the models, as described. The model calibration period covered data from January 1, 2008 to December 31, 2014. Through an iterative process of adjusting variables related to baseflow inputs, inputs related to losses, and snowmelt parameters, model calibration was completed. HEC-HMS has an internal model optimization function which allows for multiparameter optimization. Using multiparameter optimization, model input values are adjusted to better improve model results to fit the flows from the Porcupine River station.

Statistical parameters used to quantify the fit of the model to the prorated Porcupine Station flows include the Nash-Sutcliffe Efficiency (NSE), Root-Mean-Square-Error (RMSE), and the Coefficient of Determination (R^2). The R^2 value ranges from 0 to 1. A value of 0 indicates no correlation at all between the model and the prorated flows, whereas a value of 1 would indicate a perfect fit. The RMSE value describes the magnitude of variance between modelled results and the comparison data being used – a lower RMSE value means there is less deviation between model results and observed results.

The calibration model statistics of each of the three watershed models is provided from Table B1.5 to Table B1.6 within Appendix B.1. The following summarizes results of model calibration for each watershed:

- A review of calibration results for the Jocko Creek watershed indicates that the calibrated model is good with a R^2 of 0.66 and NSE of 0.64.
- A review of calibration results for the North Driftwood watershed indicates that the calibrated model is good with a R^2 of 0.54 and NSE of 0.52.
- A review of calibration results for the West Buskegau watershed indicates that the calibrated model is satisfactory with a R^2 of 0.60 and NSE of 0.46.

Overall, a review of the model statistics indicate that the calibrated models are acceptable and that the models reasonably represent local flows based on measured flow at the Porcupine River station. It is noted that as the watershed models become more complex or represent larger drainage areas, NSE values tend to decrease (Jocko Creek is the smallest and least complex, and West Buskegau is the largest [Figure 4.1 and Figure 4.3]). These changes in model statistics indicate some level variability between model results. Further improvement in statistical fit could come from use of local watershed-specific flow data to preform calibration once confidence in local station rating curves is improved. Hydrographs from each of the three models are shown in Figure 5.17 to Figure 5.19. Variances between the model and prorated flows could be attributed to differences in localized rainfall patterns between the Porcupine station watershed area generally east of Timmins, the meteorological station in Timmins and the PA north of Timmins. The following summarizes results of model calibration for each watershed:

- Within the Jocko Creek model, baseflows appear to be well represented, as are spring freshet volumes. In general, the model aligns with the flow response from the regional Porcupine station.
- Within the North Driftwood model, baseflows appear to be well represented. Spring freshet volumes tend to peak above the Porcupine prorated flows. In general, the model aligns with the flow response form the regional Porcupine station.
- Within the West Buskegau model, baseflows appear to be well represented. Spring freshet volumes tend to peak above the Porcupine prorated flows. In general, the model aligns with the flow response form the regional Porcupine station.
- Model validation will progress to align the model to LSA flows, as local watershed watercourse rating curve confidence develops.

Figure 5.17 Jocko Creek Model Calibration - January 1, 2008 to December 31, 2014

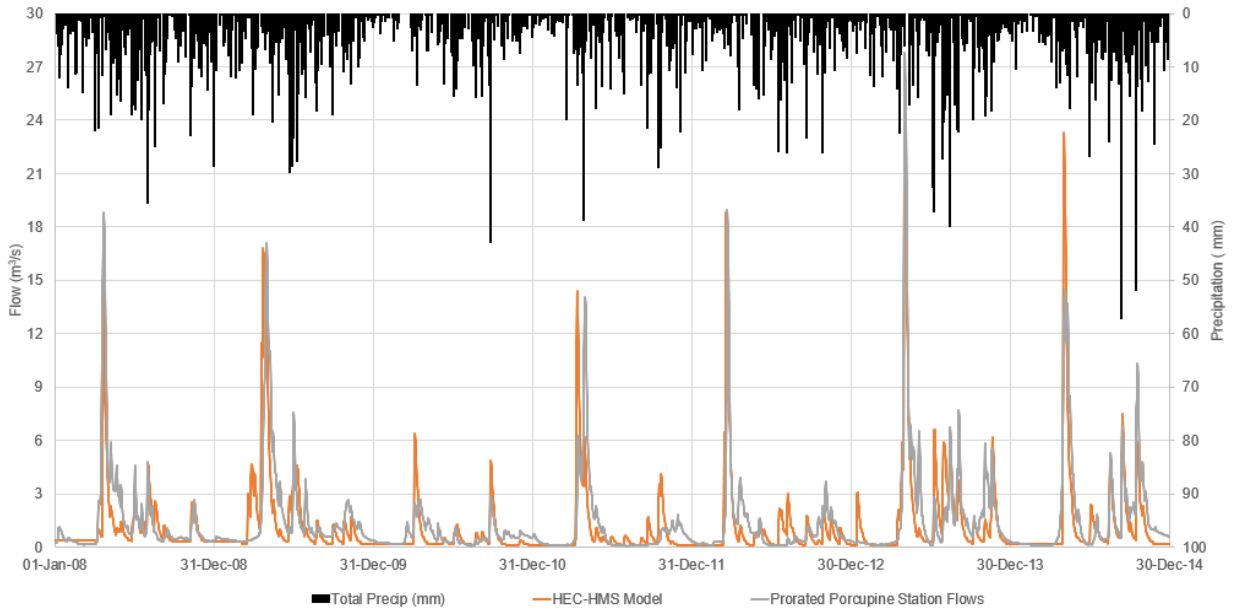

Figure 5.18 North Driftwood Model Calibration - January 1, 2008 to December 31, 2014

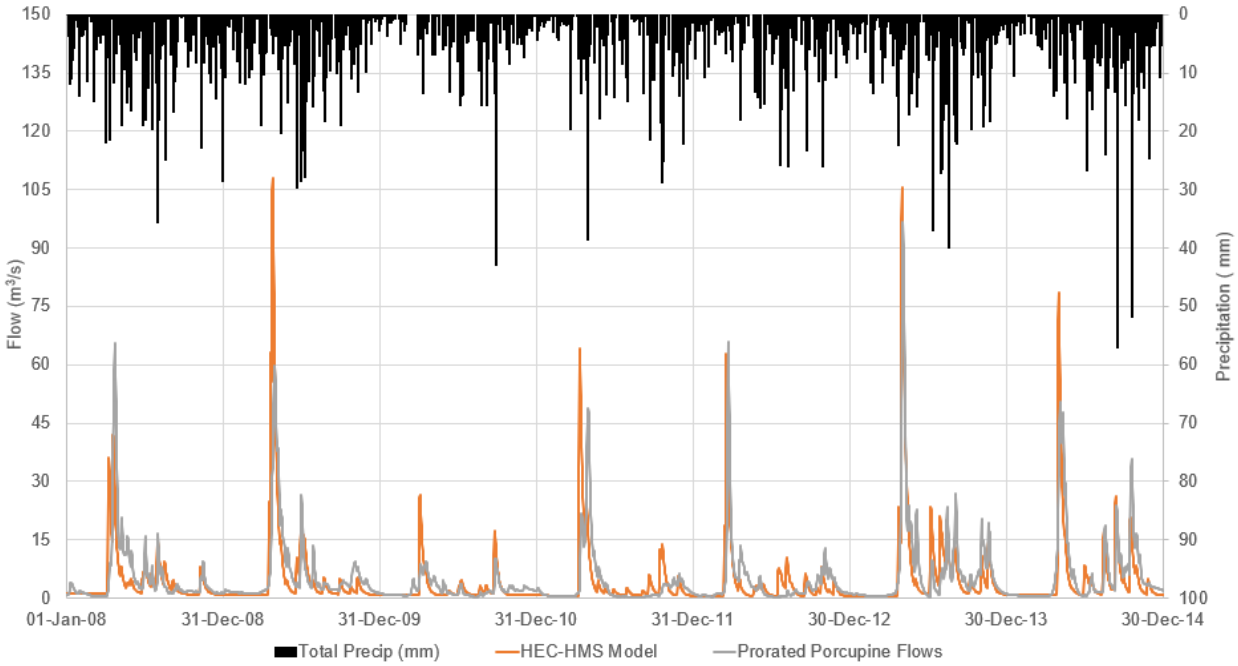

Figure 5.19 West Buskegau Model Calibration - January 1, 2008 to December 31, 2014

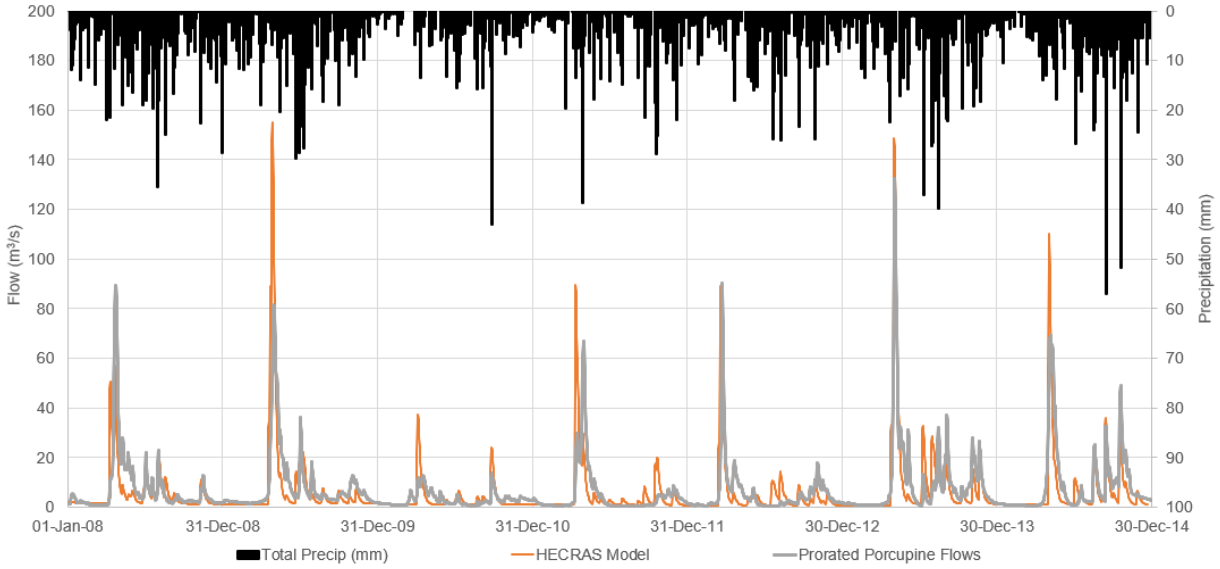

5.3 Water Quality

5.3.1 Regional Water Quality

Regional water quality data was obtained from seven monitoring stations in the Provincial Water Quality Monitoring Network (PWQMN) as discussed in Section 4.1.5. The seven watercourse monitoring stations were located within a 200 km radius of the Project Site, ranging from approximately 25 km to 193 km and located south and southeast of the Project Site. Appendix B.5 provides detailed analytical results for the sites assessed.

5.3.1.1 General Chemistry

Table 5.23 presents summary water quality statistics for the laboratory analytical general constituents. General chemistry field and laboratory analytical water quality results are presented in Appendix B.5.

In the regional watercourses, the lab pH results ranged from 1.20 to 9.16 with a 75th percentile value of 7.90 and a 25th percentile value of 7.35, indicating a circumneutral environment. There were 24 of 1143 samples where the lab pH was lower or higher than the CWQG-FAL and PWQO value range. No substantial seasonal differences for lab pH were observed. The field pH results ranged from 5.54 to 10.94 with a 75th percentile value of 7.49 and a 25th percentile value of 7.13, indicating a circumneutral environment. There were 31 of 295 samples where the field pH was lower or higher than the CWQG-FAL and PWQO criteria range. No substantial seasonal differences for field pH were observed.

Field measured dissolved oxygen results ranged from 0 mg/L to 22 mg/L with a 75th percentile of 10.00 mg/L and a 25th percentile of 6.5 mg/L with 6.5 mg/L being the CWQG-FAL lower range value for cold water fish species at other life stages. The 25th percentile dissolved oxygen value is below the CWQG-FAL cold water early life stages value of 9.5 mg/L. Dissolved oxygen was observed to be higher on average in October and November with no other substantial seasonal trends.

Total alkalinity (as $CaCO_3$) ranged from 7.4 mg/L to 296.8 mg/L with a 75th percentile of 108.0 mg/L and mean value of 78.5 mg/L. The relatively low alkalinity values indicate limited acid buffering potential. No substantial seasonal differences for alkalinity were observed.

Hardness (as $CaCO_3$) values ranged from 26 mg/L to 1500 mg/L with a 75th percentile of 308 mg/L. Hardness within the range of greater than 180 mg/L is considered very hard water (Health Canada 1979). Concentrations for copper, cadmium, lead, and nickel have hardness dependent CWQG-FAL criteria, with lower hardness values resulting in lower CWQG-FAL thresholds. Sulphate guidance is hardness dependent and is derived from the BC Water Quality Guidelines for the Protection of Freshwater Aquatic Life (BC MECCS 2023). Hardness was observed to slightly higher in the summer months than the rest of the year.

Total suspended solids (TSS) concentrations in the regional watercourse monitoring stations ranged from below the RDL (<1 mg/L) to a maximum of 22.5 mg/L with a 75th percentile of 8.4 mg/L and mean value of 5.6 mg/L.TSS varied throughout the year, with no notable seasonal trends.

Electrical conductivity ranged from 0 µS/cm to 2270 µS/cm with a 75th percentile of 660 µS/cm and mean value of 458 µS/cm. Higher conductivity values were observed during the winter and were lower in the spring through fall.

Chloride concentrations ranged from below the RDL (1 mg/L) to a maximum of 440 mg/L with a 75th percentile of 30 mg/L and mean of 21.5 mg/L. There were seven observed exceedances of the CWQG-FAL for chloride, with five measured at station 18771000602, located on Murdock Creek. Higher chloride concentrations were observed the during winter and were lower in the spring through fall, which aligns with the electrical conductivity results.

Sulphate concentrations ranged from 0.01 mg/L to a maximum of 1,430 mg/L with a 75th percentile of 190 mg/L and mean of 137.7 mg/L. With a 75th percentile hardness of 308 mg/L and mean of 191 mg/L, the BC WQG-FAL criteria of 429 mg/L applies. There were 40 exceedances out of 617 sampling events. Higher sulphate concentrations were observed the winter and lower in the spring through fall.

Where the 75th percentile (or 25th percentile value for pH and dissolved oxygen) of any parameter exceeds the PWQO or CWQG-FAL, it is identified as a PoPC. No PoPCs were identified for the general constituents of the PWQMN stations, although dissolved oxygen 25th percentile concentrations were below the CWQG-FAL guideline value for cold water early life stages (9.5 mg/L) and equal to the cold water other life stages minimum value (6.5 mg/L)

A 95th percentile parameter value was calculated to capture the upper range of natural variability within the regional dataset. In addition, the 5th percentile was used calculated to capture the lower value natural variability of pH and dissolved oxygen, which have lower limit CWQG-FAL and PWQO values. The 95th and 5th percentile results for field pH were 8.5 and 6.49, respectively, indicating slightly alkaline or acidic conditions can occur within regional watercourses and were predominantly within the PWQO value range (6.5 to 8.5). The field dissolved oxygen 5th value was below the cold water species CWQG-FAL lower range value. The sulphate 95th percentile values was observed to exceed its respective BC water quality guideline value.

Table 5.23 Summary of General Constituents in Regional Water Quality Monitoring Stations

	Parameters	Units	CCME CWQG-FAL		PWQO	Minimum	Maximum	Mean	75th Percentile (25th) [e]	95th Percentile (5th) [e]	Std. Dev.	# of Samples	# of Non-detects	# of Observed Exceedances
			Short-term	Long-term										
Watercourses	pH, Lab	S.U.	-	6.5 – 9	6.5 – 8.5	1.20	9.16	7.61	7.90 (7.35)	8.30 (6.9)	0.47	1143	0	24

	Total Suspended Solids (TSS)	mg/L	-	Narrative [a]	-	<1	22.50	5.63	8.38	15.99	5.71	25	2	N/A

Notes:

N/A - not applicable

a TSS narrative “clear flow: Maximum increase of 25 mg/L from background levels for any short-term exposure (e.g., 24-h period). Maximum average increase of 5 mg/L from background levels for longer term exposures (e.g., inputs lasting between 24 h and 30 d).”

b DO Narrative = Lowest acceptable DO concentrations for the protection of freshwater organisms; 6 mg/L or greater for early life stages of warmwater species, 5.5 mg/L or greater for other life stages of warmwater species, 9.5 mg/L or greater for early life stages of coldwater species, and 6.5 mg/L or greater for other life stages of coldwater species

c Sulphate guideline value is from British Columbia Ministry of Environment and Climate Change Strategy for the protection of aquatic life (Guideline: 128 mg/L for hardness 0 to 30 mg CaCO3·L-1; 218 mg/L for hardness 31 to 75 mg CaCO3·L-1, 309 mg/L for hardness 76 to 180 mg CaCO3·L-1, 429 mg/L for hardness 181 to 250 mg CaCO3·L-1) (Meays and Nordin 2013)

d Dissolved oxygen: Consult PWQO table depending on cold water or warm water fish species present

e Field pH and dissolved oxygen have lowest acceptable range guideline values for CCME CWQG-FAL and PWQO

5.3.1.2 Nutrients

Table 5.24 presents a summary of the laboratory analytical nutrient results with complete analytical results provided in Appendix B.5.

Nitrate concentrations in watercourses ranged from below the RDL (0.005 mg N/L) to a maximum of 5.430 mg N/L with a 75th percentile of 0.400 mg N/L. There were no observed exceedances of the CWQG-FAL for nitrate in the regional watercourses. No substantial seasonality patterns for nitrate were observed.

Nitrite concentrations ranged from below the RDL (0.001 mg/L) to a maximum of 1.98 mg/L with a 75th percentile of 0.018 mg N/L. Exceedances of the CWQG-FAL were recorded in 32 of 790 samples with the 75th percentile value below the guideline. No substantial seasonality patterns for nitrite were observed.

Ammonium (NH_4^+) represents the ionized portion of total ammonia and is what was monitored by the PWQMN program. Un-ionized ammonia (NH_3) represents the more toxic form of ammonia (CCME 2010). Un-ionized ammonia is calculated from total ammonia using field pH and water temperature values. The CWQG-FAL has a guideline table for total ammonia and a guideline value for un-ionized ammonia. The PWQO has guideline value for un-ionized ammonia. As total ammonia or un-ionized ammonia results are not available for the PWQMN program the ammonium results cannot be assessed in comparison to CCME CWQG-FAL and PWQO values. Ammonium concentrations typically were higher in the winter months.

Dissolved organic carbon (DOC) ranged from a minimum of 3.6 mg/L to a maximum of 43.5 mg/L with a 75th percentile of 13.6 mg/L and mean value of 12.03 mg/L. No substantial seasonal differences of DOC were observed.

Total phosphorous (TP) concentrations ranged from below the RDL (0.002 mg/L) to a maximum of 13,281 mg/L with a 75th percentile of 0.110 mg/L and mean of 10.898 mg/L. Station 18771000602, located on Murdock Creek, had elevated TP concentrations that were an order of magnitude higher than other regional sites, including a suspect value of 13,281 mg/L, particularly for samples collected between 1972 to 1993. When excluding station 18771000602 (Murdock Creek), TP concentrations ranged from below the RDL to a maximum of 5.25 mg/L with both a 75th percentile and mean value of 0.070 mg/L. The PWQO value for TP is 0.030 mg/L for watercourses, with a total of 706 out of 1,067 samples (excluding 18771000602) exceeding the PWQO. The 75th percentile value exceeds the respective PWQO criteria for TP and is identified as a PoPC. A seasonal pattern was observed with TP peaking in January, then decreasing in the spring to a low annual value in May and increasing slightly during the summer and fall months.

A 95th percentile value was used to capture the range of natural variability within the regional dataset. For the nutrient parameters analyzed, there was substantial natural variability captured in the dataset, with the 95th percentile values being up six times greater in value than the 75th percentile values.

Table 5.24 Summary of Nutrients in Regional Water Quality Monitoring Stations

Surface Water Feature Type	Parameters	Units	CCME		PWQO	Minimum	Maximum	Mean	75th Percentile	95th Percentile	Std. Dev.	# of Samples	# of Non-detects	# of Observed Exceedances
			Short-term	Long-term										
Watercourses	Nitrate	mg/L	124	3	-	<0.005	5.430	0.453	0.400	2.488	0.828	1,247	68	0
	Nitrite	mg/L	-	0.06	-	<0.001	1.98	0.04	0.02	0.13	0.14	790	69	32
	Ammonium	mg/L	-	-	-	0.00	1,116.00	1.47	0.17	3.07	33.86	1,087	44	N/A
	Dissolved Organic Carbon	mg/L	-	-	-	3.60	43.50	12.03	13.60	25.57	6.43	274	0	N/A
	Phosphorus, Total	mg/L	-	Guidance Framework [a]	Guidance [b]	<0.002	13,281	10.898	0.110	0.643	377.914	1,235	29	872
	Phosphorus, Total (without Station 18771000602)					<0.002	5.25	0.070	0.070	0.220	0.187	1,067	29	706

Notes:

N/A - not applicable, T – total, D - dissolved

a TP narrative = Trigger Ranges for Total Phosphorus (mg/L) (see Guidance Framework for Phosphorus factsheet): ultra-oligotrophic <0.004, oligotrophic 0.004-0.01, mesotrophic 0.01-0.02, meso-eutrophic 0.02-0.035, eutrophic 0.035-0.1, hyper-eutrophic >0.1.

b Phosphorus, total (TP): To avoid nuisance concentrations of algae in lakes, average TP concentrations for the ice-free period should not exceed 0.02 mg/L, A high level of protection against aesthetic deterioration will be provided by a TP concentration for the ice-free period of 0.01 mg/L or less. This should apply to all lakes naturally below this value, and excessive plant growth in rivers and streams should be eliminated at a TP concentration below 0.03 mg/L

5.3.1.3 Metals and Metalloids

Table 5.25 presents a summary of the laboratory analytical metal and metalloid results with individual sample event analytical results for the seven PWQMN stations provided in Appendix B.5.

Total aluminum concentrations ranged from 0.6 µg/L to 6,100 µg/L with a 75th percentile of 270 µg/L and a mean value of 223 µg/L. The CWQG-FAL for total aluminum is 5 µg/L if pH < 6.5 and 100 µg/L if pH > 6.5. The total aluminum concentrations were recorded to exceed the CWQG-FAL value for 210 of 423 sampling events along with the 75th percentile value and it is identified as a regional PoPC. A seasonal pattern was observed with total aluminum peaking in January, then decreasing in the spring and summer and increasing slightly during the fall months. The PWQMN program did not analyze for dissolved aluminum.

Total arsenic concentrations had a 75th percentile value of 9 µg/L that exceeded the CWQG-FAL and PWQO values. A total of 49% (158) of the 317 detectable results had values that exceeded the guideline values. Arsenic is identified as a regional PoPC. Arsenic concentrations were typically higher in the summer compared the other seasons.

Total cadmium concentrations in watercourses ranged from below the RDL (0.02 µg/L) to a maximum of 8.0 µg/L with a 75th percentile of 0.75 µg/L and mean of 0.58 µg/L. Out of 406 sampling events, there were 192 observed exceedances of the PWQO and CWQG-FAL criteria. The 75th percentile of total cadmium exceeds both the PWQO of 0.2 µg/L and hardness dependent interim PWQO of 0.5 µg/L and is considered a PoPC. Cadmium concentrations were observed to be lower in the winter and spring and higher in the summer and fall with a peak in December.

Total cobalt concentrations ranged from below the RDL (0.5 µg/L) to a maximum of 176 µg/L with a 75th percentile of 4.9 µg/L and a mean value of 10.5 µg/L. There were 192 recorded exceedances of the interim PWQO limit of 0.9 µg/L over 404 sampling events and is therefore considered a PoPC. No substantial seasonal differences for cobalt concentrations were observed.

Total copper concentrations ranged from below the RDL (1 µg/L) to a maximum of 350 µg/L with a 75th percentile of 14.8 µg/L and mean value of 19.3 µg/L. The CWQG-FAL and interim PWQO for copper are based on hardness and criteria are calculated per sampling event where applicable. There were 624 recorded copper exceedances of 921 samples of the PWQO. The 75th percentile of total copper exceeds both the PWQO of 5 µg/L and hardness dependent interim PWQO of 5 µg/L and is considered a PoPC. Total copper concentrations were observed to be higher in the late fall and winter and lower in the spring through early fall.

Total iron concentrations ranged from below the RDL (1 µg/L) to a maximum of 7,500 µg/L with a 75th percentile value of 690 µg/L and a mean value of 541 µg/L. Out of the 998 samples collected, there were 511 exceedances of the CWQG-FAL and PWQO, approximately 51% of the samples. The 75th percentile value exceeds the CWQG-FAL and PWQO of 300 µg/L and it is identified as a PoPC. A seasonal pattern was observed with total iron peaking in March, then decreasing throughout the spring and summer to a typically low value in May and increasing slightly during fall months.

Total lead concentrations in the regional stations have a maximum of 220 µg/L. No statistics were calculated for the lab results due to too few above detection limit samples with approximately 75% of the samples (587 of 778) as non-detects. The RDLs varied substantially at the sites over the monitoring periods (e.g., maximum RDL 30 µg/L) with a number exceeding the CWQG-FAL and PWQO values based on sample event hardness. A total of 152 exceedances were identified for 191 observed values. Based on the variation of detection limits and number of analyzed lead exceedances it is considered a regional PoPC. Observed lead concentrations were typically higher in the winter months.

Total mercury concentrations in the regional stations had a maximum value of 0.09 µg/L. No statistics were calculated for the lab results due to too few above detection limit samples with approximately 95% of the 84 samples from all stations as non-detects. The four observed mercury values exceeded the CWQG-FAL value. Out of the 80 non-detect values, 21 had RDL values above the CWQG-FAL value ranging from 0.03 to 0.09 µg/L.

Total silver results had 96 of 134 samples as non-detect with 23 of the non-detects having detection limits that exceeded the CWQG-FAL and/or PWQO values. Of the observed silver concentrations, 34 of 36 had values that exceeded the PWQO value. Of the samples collected 42% had observed values or RDLs that exceeded the guideline value and silver is considered a regional PoPC.

Total zinc concentrations ranged from below the RDL (1 µg/L) to a maximum of 73,000 µg/L with a 75th percentile of 30 µg/L and a mean value of 111 µg/L. With the maximum outlier value removed, zinc concentrations have a mean value of 33 µg/L and maximum of 2,500 µg/L. Total zinc concentrations are compared to the PWQO lower limit of 20 µg/L, with 307 exceedances recorded out of 941 sampling events. Every PWQMN station had an exceedance zinc, except station 19006400302 on Porcupine River where only 9 samples were analyzed for total zinc. Total zinc is identified as a PoPC as the 75th percentile exceeds the PWQO. Concentrations of total zinc were higher in the winter months and lower in the spring through early fall.

Other total metals and metalloids monitored (beryllium, manganese, molybdenum, nickel, uranium, vanadium, zirconium) had detection limits that were below CWQG-FAL and PWQO values. Uranium was only monitored at four regional sites (19006400102,1900640042, 19006401420, 19006404502) and zirconium at three sites (1900640042, 19006401420, 19006404502). The number of exceedances of applicable guideline values for these parameters ranged from 0% (total beryllium, total vanadium) to 24% (total manganese).

A 95th percentile value is used to capture the range of natural variability within the regional dataset (Table 5.25). For the metal and metalloid parameters analyzed the 95th percentile values were typically three to four times greater than the mean and 75th percentile values.

The regional watercourse water quality results for the seven PWQMN monitoring sites identified typically circumneutral waters with well oxygenated waters that can support cold water species at other life stages.

Table 5.25 Summary of Metals and Metalloids in Regional Water Quality Monitoring Stations

	Parameters	Units	CCME		PWQO	Minimum	Maximum	Mean	75th Percentile	95th Percentile	Std. Dev.	# of Samples	# of Non-detects	# of Observed Exceedances

i Copper: 0.001 mg/L if hardness is 0 to 20 mg CaCO3 L^{-1}, 0.005 mg/L if hardness is .20 mg CaCO3 L^{-1}

j Lead: 0.001 mg/L if hardness is <30 mg CaCO3 L^{-1}, 0.003 mg/L if hardness is 30 to 80 mg CaCO3 L^{-1}, 0.005 mg/L if hardness is > 80 mg CaCO3 L^{-1}

Regional water quality is classified as very hard with low alkalinity indicating limited acid buffering potential. No general chemistry parameter 75th percentile values (or 25th percentile values for pH and dissolved oxygen) exceeding or outside of CWQG-FAL and PWQO value ranges. Nitrogen compounds (nitrate and nitrite) were typically below CWQG-FAL values. Total phosphorus was identified as a PoPC exceeding the PWQO value for rivers (0.03 mg/L) with higher values in winter months. Total aluminum, arsenic, cadmium, cobalt, copper, iron, lead, silver, and zinc were identified as PoPCs. Metal and metalloid concentrations were typically higher during the winter months or did not observe seasonal trends.

5.3.2 Local Water Quality

To facilitate data analysis and discussion, results are assessed by grouping monitoring stations located in waterbodies and watercourses, outlined in Section 4.2.2. Appendix B.6 provides detailed analytical results for all sites. From 2021 to 2023, a total of 33 watercourse locations and 13 waterbody locations were sampled across three main watersheds, Jocko Creek (nine sites), North Driftwood River (22 sites), and West Buskegau River watersheds (15 sites) (Figure 7-5). Monitoring locations were aggregated by both type (watercourses and waterbodies), and by watershed to assess water quality relationships of water feature type, watershed, and seasonality.

Appendix C presents the Laboratory Certificates of Analysis for the surface water quality samples.

5.3.2.1 General Chemistry

Table 5.26 presents summary water quality statistics for the laboratory analytical general constituents. General chemistry field and laboratory analytical water quality results are presented in Appendix B.6. Seasonal analysis results are provided in Appendix B.8. Watershed analysis results are presented in Appendix B.9.

The field pH results ranged from 2.79 to 7.90 with a 75th percentile value of 6.71 and 25th percentile value of 5.14 in watercourses. Field pH ranged from 4.09 to 8.05 with a 75th percentile of 7.34 and 25th percentile value of 5.61 in waterbodies, indicating slightly acidic conditions in both types of surface water features. Field pH results were observed below the lower limit of both the CWQG-FAL and PWQO pH 6.5 value in 115 of 183 samples and for the 25th percentile value. A seasonal trend was observed in both watercourses and waterbodies with lower pH values in the summer months (July to September) and higher pH values in the winter months (January to March). Jocko Creek, North Driftwood River and West Buskegau River watersheds had similar pH levels, with a 25th percentile of 5.15, 5.73, and 5.02, respectively (Appendix B.9).

Field dissolved oxygen ranged from 0.09 mg/L to 19.73 mg/L with a 75th percentile of 9.37 mg/L and 25th percentile value of 5.65 mg/L in watercourses. In waterbodies, field dissolved oxygen ranged from 3.34 mg/L to 17.89 mg/L with a 75th percentile of 9.29 mg/L and 25th percentile value of 6.59 mg/L. The 25th percentile values are above the PWQO for cold water species of 5 mg/L and watercourses below the CWQG-FAL values for cold water species other life stages. Field dissolved oxygen was observed to be higher in the winter and early spring and lower in the late spring through fall for watercourses and

waterbodies. The 25th percentile of field dissolved oxygen was 6.38 mg/L in Jocko Creek watershed, 5.4 mg/L in North Driftwood River watershed, and 6.02 mg/L in West Buskegau River watershed.

Total alkalinity (as $CaCO_3$) ranged from below the RDL (1 mg/L) to 134 mg/L with a 75th percentile of 50.8 mg/L and mean value of 34.6 mg/L in watercourses. The total alkalinity in waterbodies ranged from 4.6 mg/L to 268 mg/L with a 75th percentile of 118 mg/L and a mean value of 79.1 mg/L. The relatively low alkalinity values in watercourses and waterbodies indicate limited acid buffering potential. Jocko Creek and West Buskegau River watersheds had similar alkalinity, with a 75th percentile of 52 mg/L and 50 mg/L, respectively. The North Driftwood River watershed had a higher alkalinity, with a 75th percentile of 82 mg/L. No substantial seasonal trends for total alkalinity were observed for the watercourse or waterbody monitoring locations.

Hardness (as $CaCO_3$) values ranged from 6 mg/L to 189 mg/L with a mean value of 43 mg/L and 75th percentile concentration of 55 mg/L in watercourses. In waterbodies, the hardness ranged from 11.3 mg/L to 233 mg/L with a mean value of 77 mg/L and 75th percentile concentration 110 mg/L. Hardness within the range of 60 to less than 120 mg/L is considered medium hardness (CCME 1979). Concentrations for copper, cadmium, lead, and nickel have hardness dependent CWQG-FAL criteria, with lower hardness values resulting in lower CWQG-FAL thresholds. Sulphate guidance is hardness dependent and is derived from the BC Water Quality Guidelines for the Protection of Freshwater Aquatic Life (BC MECCS 2023). Jocko Creek and West Buskegau River watersheds had similar hardness values, with a 75th percentile of 53 mg/L and 54 mg/L, respectively, which are within the soft water categorization. The North Driftwood River watershed had a higher hardness, with a 75th percentile of 81 mg/L. No substantial seasonal trends for total hardness were observed for the watercourse or waterbody monitoring locations.

Total suspended solids (TSS) concentrations in watercourse monitoring stations ranged from below the RDL (0.67 mg/L) to 80 mg/L with a mean value of 6.6 mg/L and 75th percentile concentration of 7.7 mg/L. TSS in waterbodies ranged from below the RDL (0.67 mg/L) to 27.3 mg/L with 41 of 75 samples below the RDL and therefore no statistics were calculated. In Jocko Creek watershed, TSS concentrations had a 75th percentile value of 6.4 mg/L. The North Driftwood River watershed had a 75th percentile value of 5.7 mg/L and the West Buskegau River watershed had the highest 75th percentile of the three watersheds with a value of 7.7 mg/L. TSS was observed to be slightly higher in the winter months in watercourses and in the late fall for waterbodies.

Field specific conductivity results in watercourses from 0.017 mS/cm to 0.602 mS/cm with a mean value of 0.088 mS/cm. In waterbodies, the field specific conductivity ranged from 0.016 mS/cm to 0.780 mS/cm with a mean value of 0.140 mS/cm. Field dissolved oxygen was observed to be higher in the winter months and lower in the spring through fall for watercourses and waterbodies, with a stronger seasonal trend observed in watercourse monitoring locations. Jocko Creek and North Driftwood River watersheds had similar field specific conductivities with a 75th percentile of 0.12 mS/cm and 0.13 mS/cm, respectively. The West Buskegau River watershed had a slightly lower overall specific conductivity, with a 75th percentile of 0.09 mS/cm.

Chloride concentrations in watercourses ranged from below the RDL (0.2 mg/L) to a maximum of 56.9 mg/L with a 75th percentile value of 3.1 m/L. In waterbodies, chloride concentrations ranged from below the detection limit (0.2 mg/L) with a maximum value of 1.1 mg/L. No statistics were calculated for the waterbodies due to too few above RDL results. Above 75th percentile chloride concentrations were observed at JC-S-01 in February and March 2023. Located 200 m west of highway 655, the temporary elevated chloride concentrations at the monitoring location may be influenced by seasonal road salting. There were no observed exceedances of the CWQG-FAL for chloride in either the monitored watercourses or waterbodies. Jocko Creek and North Driftwood River watersheds had similar chloride values, with a 75th percentile of 4.6 mg/L and 4.2 mg/L, respectively. The West Buskegau River watershed had notably lower chloride concentrations, with a 75th percentile of 0.4 mg/L.

Sulphate concentrations ranged from below the RDL (0.3 mg/L for ALS and 0.5 mg/L for Testmark) to a maximum of 201 mg/L with a 75th percentile value of 1.2 mg/L in watercourses. The two highest sulphate concentrations were both measured in KC-01 in February 2023 and March 2023 with values of 201 mg/L and 158 mg/L, respectively. KC-01 is located on Kidd Creek and is downstream of the Glencore Kidd Mine, which extracts base metals (copper, zinc, and silver). Sulphate concentrations ranged from below the RDL to a maximum of 4.08 mg/L with a 75th percentile value of 1.60 mg/L in waterbodies. With a 75th percentile hardness of 53 mg/L and 54 mg/L, Jocko Creek and West Buskegau River watersheds have a BC WQG-FAL criteria of 218 mg/L. The North Driftwood River watershed had a 75th percentile hardness of 81 mg/L, indicating a sulphate criteria of 309 mg/L for the watershed. The sulphate 75th percentile concentrations were below the respective guidelines for each watershed. Jocko Creek watershed had a 75th percentile concentration of 3.7 mg/L for sulphate, the North Driftwood River watershed had a 75th percentile value of 1.0 mg/L, and the West Buskegau River watershed had 75th percentile value of 0.9 mg/L.

Cyanide (free) in watercourses ranged from below the RDL (0.001 mg/L) to 0.0186 mg/L with a mean of 0.0026 mg/L and 75th percentile value of 0.0030 mg/L. Cyanide (free) in waterbodies ranged from below the RDL (0.001 mg/L) to a maximum of 0.007 mg/L. No statistics were calculated for the waterbodies due to too few above RDL results, with 72% of the samples having non-detect values. Exceedances of the CWQG-FAL for cyanide (free) were recorded for 11 of 210 sampling events in watercourses and one of 71 sampling events in waterbodies. Jocko Creek watershed had a cyanide (free) 75th percentile value of 0.0040 mg/L. The West Buskegau River and North Driftwood River watersheds had slightly lower concentrations, with a 75th percentile of 0.0034 mg/L and 0.0030 mg/L, respectively.

Cyanide (WAD) ranged from below the RDL (0.001 mg/L) to 0.0120 mg/L with a mean value of 0.0025 mg/L and 75th percentile of 0.0030 mg/L. In waterbodies, cyanide (WAD) ranged from below the RDL to a maximum of 0.0160 mg/L. No statistics were calculated for the waterbodies due to too few above detection limit samples, with 76% of the samples as non-detects. Exceedances of the CWQG-FAL and PWQO for cyanide (WAD) were recorded for 12 of 209 sampling events in watercourses and one of 71 sampling events in waterbodies. The 75th percentile of cyanide (WAD) was 0.0030 mg/L in Jocko Creek watershed, 0.0021 mg/L in North Driftwood River watershed, and 0.0040 mg/L in West Buskegau watershed.

Fluoride ranged from below the RDL (0.05 mg/L) to a maximum of 0.32 mg/L in watercourses. In waterbodies, fluoride ranged from below the RDL (0.05 mg/L) to a maximum of 0.11 mg/L. No statistics were calculated for the watercourses and waterbodies due to the number of results with below RDL values. There were three observed exceedances of the long-term CWQG-FAL criteria, at KC-01 in the Jocko Creek watershed in February 2023, and WBR-P-03 in May 2023, and WBR-S-REF in November 2023 with both located in the West Buskegau River watershed. No exceedances were observed in the North Driftwood River watershed, with the maximum value of 0.11 mg/L recoded at GERLK (Gerry Lake) in May 2023.

Chrysotile asbestos samples were collected in December 2023 at 12 watercourse monitoring locations and one waterbody location. The water samples were analyzed for determination of asbestos structures of lengths ≥0.5 µm and >10 µm. The samples analyzed were below the RDL of 0.20 MFL (million fibres per litre) at the 12 watercourse locations. The waterbody location sampled, Martin Lake (MARLK) had a detected fibre ≥0.5 µm with a concentration of 0.51 MFL. Due to the number of non-detect results, no seasonal or watershed patterns were observed.

Samples for Radium-226 analysis were collected in October 2021 at three watercourse locations and in August 2021 and one waterbody location. Samples were collected in December 2023 at 12 watercourse monitoring locations and one waterbody location. Approximately 71% of the sample results were below the RDL of 0.005 Bq/L with the maximum value recorded of 0.009 Bq/L at MATR-02, located on the Mattagami River in the Jocko Creek watershed. There were no occurrences of Radium-226 exceeding the PWQO guideline of 1 Bq/L. Due to the number of non-detect results for radium-226, no seasonal or watershed patterns were observed.

Table 5.26 Summary of General Constituents in Local Water Quality Monitoring Stations

	Parameters	Units	RDL	CCME		PWQO	Minimum	Maximum	Mean	75th Percentile (25th) [e]	95th Percentile (5th) [e]	Std. Dev.	# of Samples	# of Non-detects	# of Observed Exceedances

				Short-term	Long-term										
	Total Alkalinity (as $CaCO_3$)	mg/L	2	-	-	-	4.6	268.0	79.1	118.0	155.4	51.7	75	0	NA
	Total Suspended Solids (TSS)	mg/L	0.67	-	Narrative [a]	-	-	27.30	-	-	-	-	75	41	0

Notes:

NA - not applicable, T – total, D - dissolved

a TSS narrative “clear flow: Maximum increase of 25 mg/L from background levels for any short-term exposure (e.g., 24-h period). Maximum average increase of 5 mg/L from background levels for longer term exposures (e.g., inputs lasting between 24 h and 30 d).”

b DO Narrative = Lowest acceptable DO concentrations for the protection of freshwater organisms; 6 mg/L or greater for early life stages of warmwater species, 5.5 mg/L or greater for other life stages of warmwater species, 9.5 mg/L or greater for early life stages of coldwater species, and 6.5 mg/L or greater for other life stages of coldwater species

c Sulphate guideline value is from British Columbia Ministry of Environment and Climate Change Strategy for the protection of aquatic life (Guideline: 128 mg/L for hardness 0 to 30 mg CaCO3·L-1; 218 mg/L for hardness 31 to 75 mg CaCO3·L-1, 309 mg/L for hardness 76 to 180 mg CaCO3·L-1, 429 mg/L for hardness 181 to 250 mg CaCO3·L-1) (Meays and Nordin 2013)

d Dissolved oxygen: Consult PWQO table depending on cold water or warm water fish species present

e Field pH and dissolved oxygen have lowest acceptable range guideline values for CCME CWQG-FAL and PWQO and lower percentile results are used for assessment

f Dissolved oxygen guideline applied of CCME CWQG-FAL cold water other life stages (6.5 mg/L)

5.3.2.1.1 Lake Profiles

For select lakes in the North Driftwood River watershed, temperature and DO measurements were collected to assess the vertical profile in spring, summer, and fall seasons (Table 5.27). Measurements were collected at 1 m depth intervals, targeting the deepest part of the waterbody. A thermocline is identified by a distinct steep temperature gradient over a several metre depth. Lake profile data were collected by WSP in 2022 and 2023 (WSP 2024).

Table 5.27 Lake Profiles Summary

Station ID (Site)	Sampling Date	Maximum Measured Water Depth (m)	Thermocline Depth (m)
GERLK (Gerry Lake)	August 2022	14	2.5
	October 2022	14	7.5
	June 2023	10	3
	July 2023	11	3
MARLK (Martin Lake)	August 2022	10	3
	June 2023	10	1
JACLK (Jack Lake)	September 2022	15	8
	October 2022	15	12
SUTHLK (Sutherland Lake)	September 2022	20	4.5
	October 2022	15	8
	June 2023	10	3.5
MELLK (Mel Lake)	September 2022	18	6
DAVLK (Davis Lake)	September 2022	20	4.5

Gerry Lake profiles were measured in August and October 2022 and in June and July 2023 (Figure A.19.1, Appendix A) and observed thermal stratification for the spring, summer and fall events. The thermocline in October 2022 was observed to be 4.5 m deeper than the spring and summer monitoring events indicating the lake was approaching a fall turnover event.

Martin Lake profiles were measured in August 2022 and June 2023 by WSP staff (Figure A.19.2, Appendix A), which both observed thermally stratified conditions. The August 2022 event had an anoxic hypolimnion. In August 2022, a thermocline was present, starting at approximately 3 m depth. In June 2023, a thermocline was present, starting at approximately 2.5 m depth and low oxygen conditions within the hypolimnion but approaching anoxic conditions until close to 10 m below the water surface.

Jack Lake profiles were measured in September and October 2022 (Figure A.19.3, Appendix A) and observed thermal stratification with thermoclines extending 8 m below the water surface for the September 2022 event and starting at 12 m for the October 2022 event. The September 2022 event observed an anoxic hypolimnion and the October 2022 event observed low oxygen concentrations in the upper epilimnion (1-2 m below the surface).

Sutherland Lake profiles were measured for two sampling events in 2022 and one sample event in 2023 by WSP staff (Figure A-19-4, Appendix A). In September 2022, a thermocline was present starting at a depth of 4.5 m, indicating thermal stratification and limited mixing. While a distinct temperature gradient change was present around 8 m in October 2022, there was overall reduced thermal stratification, with less temperature difference between the upper and lower layers of water. In addition, DO increased with depth, suggesting the fall turnover event approaching for the waterbody. In June 2023, a thermocline was present starting at approximately 3.5 m, indicating that Sutherland Lake was thermally stratified with anoxic conditions in the lower 5 m of the hypolimnion.

Mel Lake profiles were measured once in September 2022 by WSP (Figure A.19.5, Appendix A). The maximum measured water depth was 18 m. A thermocline was present, starting at a depth of 6 m with anoxic conditions in the hypolimnion.

The Davis Lake profile was measured in September 2022 by WSP (Figure A.19.6, Appendix A) identifying a thermally stratified condition. The monitoring event observed anoxic (low oxygen) conditions in the hypolimnion (water depths below thermocline).

5.3.2.2 Nutrients

Table 5.28 presents a summary of the laboratory analytical nutrient results with complete analytical results provided in Appendix B.6. Seasonal analysis results are provided in Appendix B.8. Watershed analysis results are presented in Appendix B.9.

Nitrate (NO_3) as N (nitrogen) concentrations in watercourses ranged from below the RDL (0.02 mg N/L) to a maximum of 2.30 mg N/L. In waterbodies, nitrate concentrations ranged from below the RDL value, with a maximum value of 0.70 mg N/L. No statistics were calculated for the lab results due the number of non-detect values with approximately 59% non-detects in watercourses and 95% non-detects in waterbodies. There were no observed exceedances of the CWQG-FAL for nitrate in either the monitored watercourses or waterbodies. Due to the amount of non-detect results, no seasonal or watershed patterns were observed.

Similarly, nitrite (NO_2) as N concentrations ranged from below the RDL (0.01 mg N/L) to a maximum of 0.05 mg N/L in watercourses with no exceedances of the CWQG-FAL recorded. In waterbodies, nitrite concentrations ranged from below the RDL to a maximum of 0.32 mg N/L, which was a single CWQG-FAL exceedance reported at GERLK for the December 2023 event. No statistics were calculated for the lab results due to the number of non-detect results with approximately 82% non-detects in watercourses and 92% non-detects in waterbodies. In addition, no seasonal or watershed patterns were observed due to the number of non-detect samples.

Total ammonia (as N) ranged from below the RDL (0.005 mg/L) to 0.408 mg/L with a mean value of 0.053 mg/L and 75th percentile of 0.062 mg/L in watercourses. In waterbodies, total ammonia (as N) ranged from below the RDL to 0.356 mg/L with a mean value of 0.033 mg/L and 75th percentile of 0.039 mg/L. There were no exceedances of the CWQG-FAL guideline for total ammonia (as N) observed in either the watercourses or waterbodies. The CWQG-FAL total ammonia guideline values are field water temperature and field pH dependent was developed to convert un-ionized ammonia to total ammonia

(CCME 2010). A total ammonia concentration higher than the CWQG-FAL guideline value would also exceed the un-ionized ammonia CWQG-FAL guideline value. Total ammonia (as N) was observed to be higher in the late fall and winter months and lower in the spring and summer in both watercourses and waterbody monitoring locations. The 75th percentile of total ammonia (as N) was 0.057 mg/L in Jocko Creek watershed, 0.048 mg/L in the North Driftwood watershed, and 0.069 mg/L in the West Buskegau River watershed.

DOC in watercourses ranged from below 0.4 mg/L to 58.6 mg/L with a mean value of 31.1 mg/L and 75th percentile 42.0 mg/L. In waterbodies, DOC ranged from 5.9 mg/L to 46.0 mg/L with a mean value of 20.3 mg/L and 75th percentile of 28.2 mg/L. DOC concentrations were observed to be slightly higher in the fall months in both watercourses and waterbodies with no other substantial seasonal trends noted. Jocko Creek and North Driftwood River watersheds had similar DOC concentrations with 75th percentile values of 33.1 mg/L and 32.2 mg/L, respectively. The West Buskegau River watershed had a higher 75th percentile of 44.6 mg/L.

Total phosphorous (TP) concentrations ranged from below the RDL (0.002 mg/L) to a maximum of 0.119 mg/L with a 75th percentile of 0.033 mg/L and mean of 0.025 mg/L in watercourses. The TP in waterbodies ranged from below the RDL (0.002 mg/L) to a maximum of 0.233 mg/L with a 75th percentile of 0.020 mg/L and mean value of 0.022 mg/L. PWQO values for TP are 0.030 mg/L and 0.020 mg/L for watercourses and waterbodies, respectively. There were a total of 83 exceedances of the PWQO from 316 sampling events, 66 in the watercourses and 17 in the waterbodies. The 75th percentile values of both the watercourses and waterbodies exceed their respective PWQO criteria and TP is identified as a PoPC. Under the Ministry of Environment and Energy Water Management Policies for PWQO, surface water quality which does not presently meet the PWQO, is considered a Policy 2 parameter and shall not be further degraded for the respective parameter (MOEE 1994).

A seasonal pattern of TP was observed with concentrations peaking in March, then decreasing in the spring to a low annual value in May and increasing slightly during the summer and fall months (Figure 5.15). A similar seasonality trend was observed in each of the three watersheds, with Jocko Creek watershed having slightly lower total phosphorous concentrations than the North Driftwood River and West Buskegau River watersheds in the summer and fall. Due to several high TP values in waterbodies, the North Driftwood River watershed experiences a spike in TP in December, which is not observed in the other watersheds.

Figure 5.20 Seasonal Variation of Total Phosphorous in All Project Site Monitoring Locations and Three Main Watersheds (Jocko Creek, North Driftwood River, and West Buskegau River)

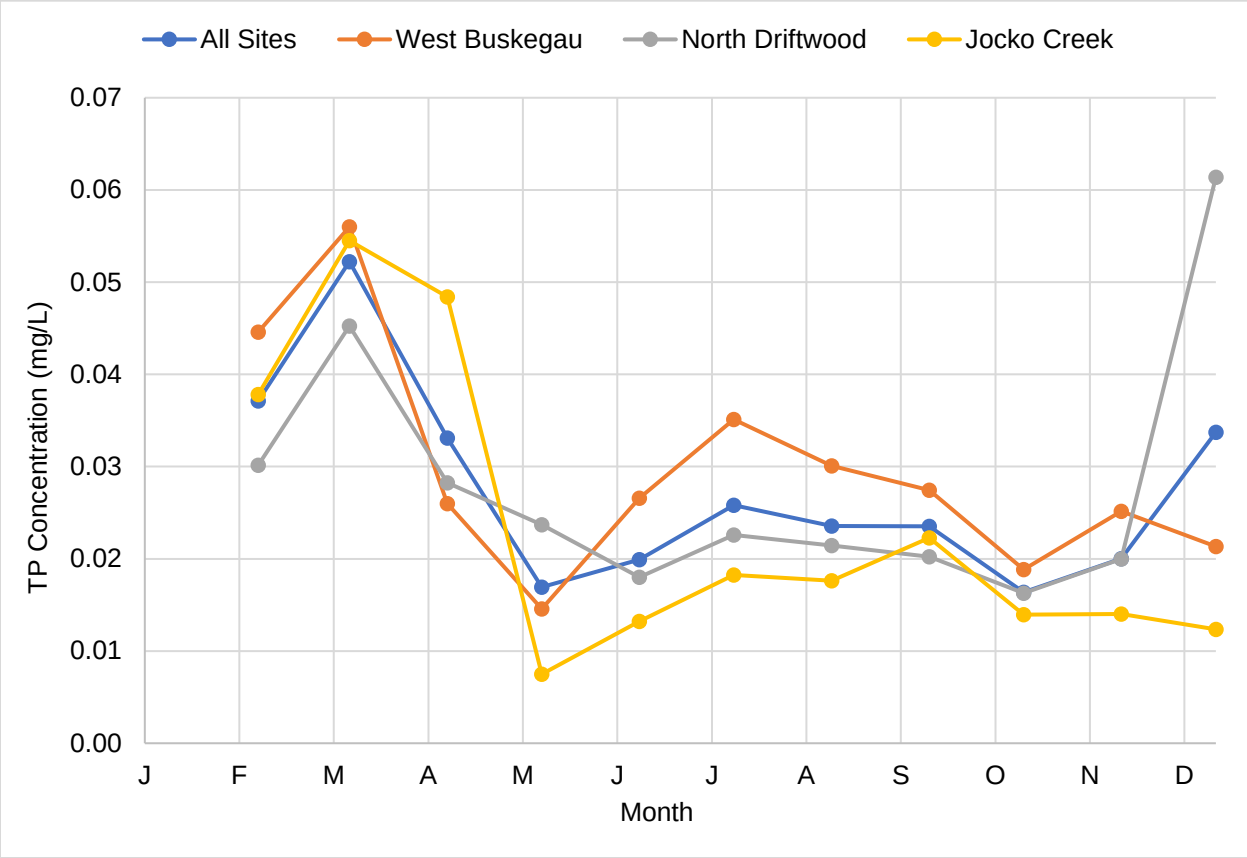

Table 5.28 Summary of Nutrients in Local Water Quality Monitoring Stations

	Parameters	Units	RDL	CCME		PWQO	Minimum	Maximum	Mean	75th Percentile	95th Percentile	Std. Dev.	# of Samples	# of Non-detects	# of Exceedances

Notes:

NA - not applicable, T – total, D - dissolved

a Total Ammonia as N table is temperature and pH dependent. Measurements of total ammonia in the aquatic environment are often expressed as mg/L total ammonia-N. The present guideline values (mg/L NH3) can be converted to mg/L total ammonia-N by multiplying the corresponding guideline value by 0.8224. Consult the CWQG-FAL factsheet for specific table.

b TP narrative = Trigger Ranges for Total Phosphorus (mg/L) (see Guidance Framework for Phosphorus factsheet): ultra-oligotrophic <0.004, oligotrophic 0.004-0.01, mesotrophic 0.01-0.02, meso-eutrophic 0.02-0.035, eutrophic 0.035-0.1, hyper-eutrophic >0.1.

c Phosphorus, total (TP): To avoid nuisance concentrations of algae in lakes, average TP concentrations for the ice-free period should not exceed 0.02 mg/L, A high level of protection against aesthetic deterioration will be provided by a TP concentration for the ice-free period of 0.01 mg/L or less. This should apply to all lakes naturally below this value, and excessive plant growth in rivers and streams should be eliminated at a TP concentration below 0.03 mg/L

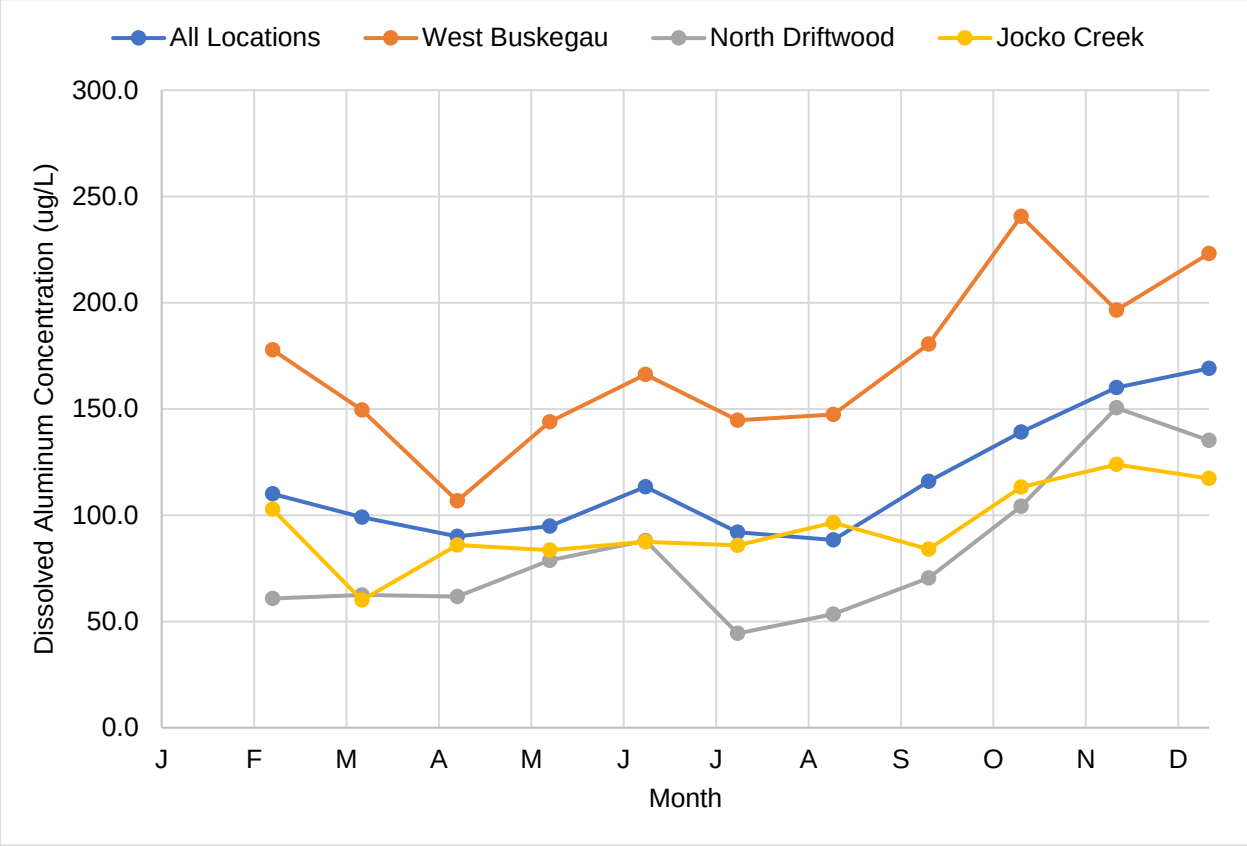
5.3.2.3 Metals and Metalloids

Table 5.29 presents a summary of the laboratory analytical metal and metalloid results with complete analytical results provided in Appendix B.6. Seasonal analysis results are provided in Appendix B.8. Watershed analysis results are presented in Appendix B.9.

Dissolved aluminum concentrations, filtered with 0.2 µm filter represent clay-free samples, ranged from 14 µg/L to 202 µg/L with a 75th percentile of 107 µg/L and mean value of 82 µg/L in watercourses. Dissolved aluminum (0.2 µm filter) concentrations in waterbodies ranged from 2 µg/L to 141 µg/L with a 75th percentile of 43 µg/L and a mean value of 37 µg/L. The PWQO of aluminum as a clay-free sample is 75 µg/L if the pH is between 6.5 – 9.0. The 75th percentile of watercourses exceeds the PWQO and is therefore identified as a PoPC. In waterbodies, 12 samples were measured using the 0.2 micron filter technique and the 75th percentile did not exceed the PWQO. The 75th percentile values of dissolved aluminum in watercourses exceeds the respective criteria and is identified as a PoPC and is anticipated to be a Policy 2 parameter (MOEE 1994). Jocko Creek and North Driftwood River watersheds had similar dissolved aluminum values, with a 75th percentile of 75 µg/L and 86 µg/L, respectively. The West Buskegau River watershed had higher dissolved aluminum concentrations, with a 75th percentile of 133 µg/L.

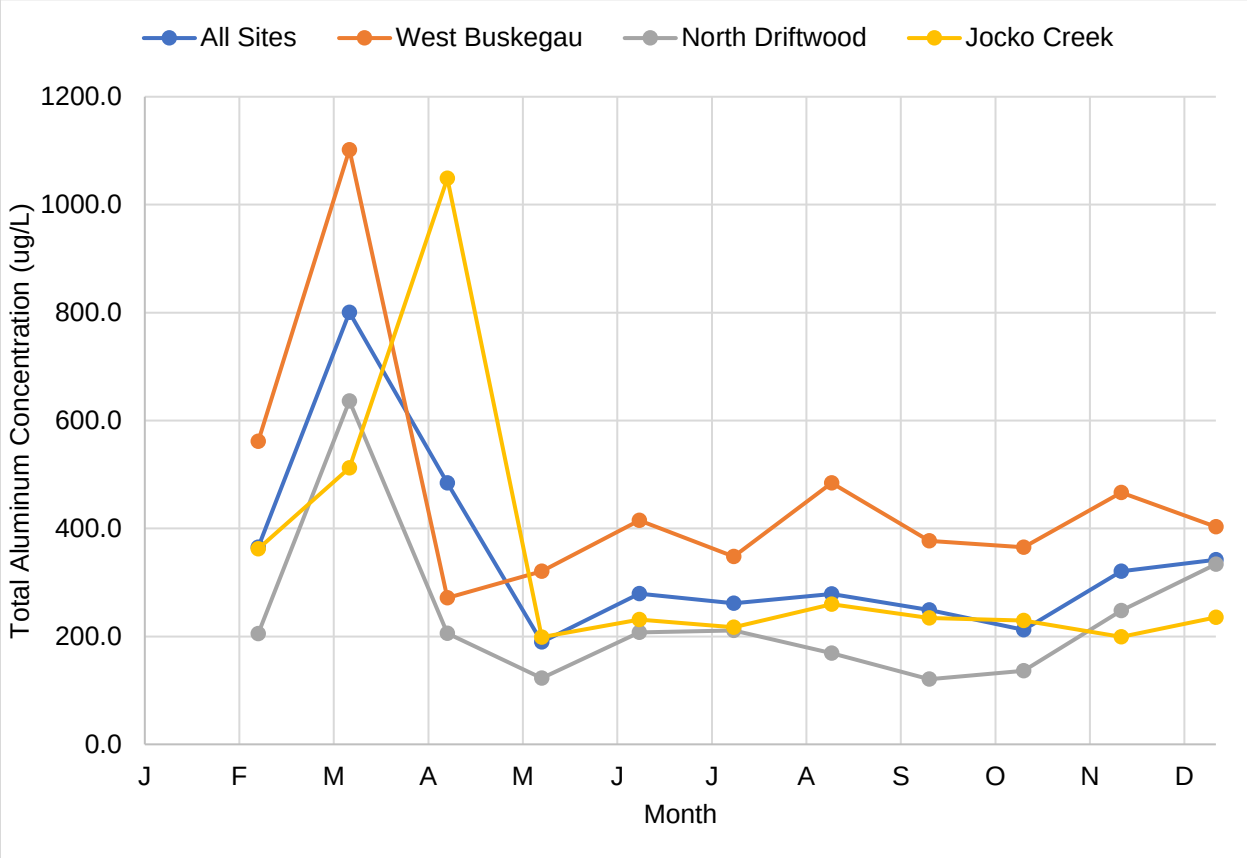
Dissolved aluminum concentrations, filtered with a 0.45 µm filter, ranged from 11 µg/L to 378 µg/L with a 75th percentile of 174 µg/L and a mean value of 133 µg/L in watercourses. In waterbodies, dissolved aluminum ranged from less than the RDL (1 µg/L) to a maximum of 243 µg/L with a 75th percentile of 74 µg/L and a mean value of 51 µg/L. The 0.45 µm filter is a standardized filter and is not considered representative of a clay-free sample. Dissolved aluminum concentrations were observed to be slightly higher in the fall and early winter, with the West Buskegau River watershed experiencing more substantial variation (Figure 5.21). Jocko Creek and North Driftwood River watersheds had similar dissolved aluminum (0.45 µm) values, with a 75th percentile of 120 µg/L and 135 µg/L, respectively. The West Buskegau River watershed had higher dissolved aluminum concentrations, with a 75th percentile of 230 µg/L.

Figure 5.21 Seasonal Variation of Dissolved Aluminum in All Project Site Monitoring Locations and by Watershed



Total aluminum concentrations in watercourses ranged from 26 µg/L to 3,210 µg/L with a 75th percentile of 424 µg/L and a mean value of 361 µg/L. In waterbodies, total aluminum ranged from 3.4 µg/L to 378 µg/L with a 75th percentile of 148 µg/L and a mean value of 91.4 µg/L. The CWQG-FAL for total aluminum is 5 µg/L if pH < 6.5 and 100 µg/L if pH > 6.5. The total aluminum concentrations were recorded to exceed the CWQG-FAL value in 250 of 317 sampling events. A seasonal pattern was observed with total aluminum peaking in March, then decreasing in the spring and increasing slightly during the summer and fall months (Figure 5.22). A similar seasonality trend was observed in each of the three watersheds, with North Driftwood River watershed having slightly lower total aluminum concentrations than the other watersheds. Jocko Creek watershed has a temporal difference from the other watersheds with concentrations peaking in April. Jocko Creek watershed had a 75th percentile of 324 µg/L for total aluminum. The North Driftwood River watershed had a 75th percentile of 260 µg/L. Total aluminum concentrations in the West Buskegau River watershed were higher than the other watersheds with a 75th percentile value of 598 µg/L.

Figure 5.22 Seasonal Variation of Total Aluminum in All Project Site Monitoring Locations and by Watershed



Total cadmium concentrations in watercourses ranged from below the RDL (0.005 µg/L) to a maximum of 0.330 µg/L with a mean of 0.037 µg/L and 75th percentile of 0.042 µg/L. In waterbodies, the total cadmium concentration ranged from below the RDL to a maximum of 0.080 µg/L with 37 of 75 samples below the RDL and therefore no statistics were calculated. There were 24 of 317 recorded exceedances of the PWQO and CWQG-FAL values, which are hardness dependent. Cadmium concentrations were observed to be higher in the winter and early spring and lower in the late spring through fall for watercourses. In waterbodies, cadmium concentrations were higher in the late fall to winter months and lower in spring to early fall. Total cadmium concentrations were similar in Jocko Creek watershed and the West Buskegau River watershed, both with a 75th percentile value of 0.050 µg/L. The North Driftwood River watershed had slightly lower total cadmium concentrations, with a 75th percentile of 0.030 µg/L.

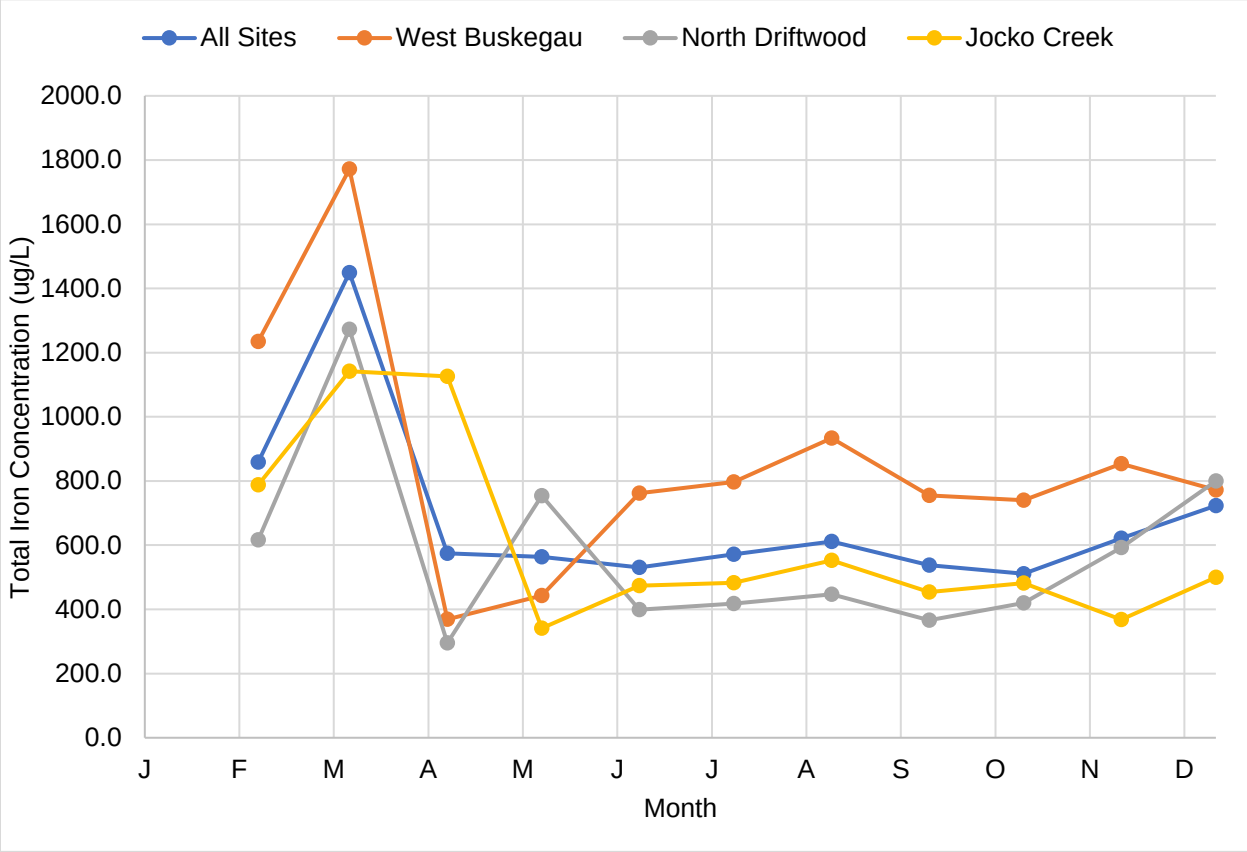
Total cobalt concentrations in watercourses ranged from below the RDL (0.1 µg/L) to a maximum of 1.8 µg/L with both a 75th percentile and mean value of 0.3 µg/L. In waterbodies, total cobalt concentrations ranged from below the RDL to a maximum of 0.5 µg/L. Approximately 65% of the samples had non-detect values for the waterbodies. There were six recorded exceedances of the PWQO limit of 0.9 µg/L of 242 total samples in watercourses and no recorded exceedances in waterbodies.

Exceedances were recorded at KC-01 in Jocko Creek and WBR-P-03, WBR-S-06, and WBR-S-REF in the West Buskegau River. Cobalt concentrations were observed to be higher in the winter and lower in spring through fall, with the highest values recorded in March. No substantial differences were observed for total cobalt concentrations between the three main watersheds.

Total copper concentrations ranged from below the RDL (0.5 µg/L) to a maximum of 52.0 µg/L with a 75th percentile of 2.0 µg/L and mean value of 1.9 µg/L in watercourses. Total copper ranged from below the reportable detection limit to a maximum of 4.1 µg/L in waterbodies, with approximately 53% of the results having non-detect values. The CWQG-FAL and interim PWQO for copper are based on hardness and guideline values are calculated per sampling event where applicable. There were 65 exceedances of the applicable criteria recorded out of 317 samples. There were no substantial seasonal differences observed in total copper concentrations in the watercourse and waterbody monitoring locations. Total copper concentrations were similar in Jocko Creek watershed and the West Buskegau River watershed with 75th percentile values of 2.0 µg/L and 2.2 µg/L, respectively. The North Driftwood River watershed had a slightly lower 75th percentile total copper concentration of 1.5 µg/L.

Total iron concentrations in watercourses ranged from a minimum of 130 µg/L to a maximum of 3,640 µg/L with a 75th percentile of 800 µg/L and a mean value of 695 µg/L. In waterbodies, total iron ranged from below the reportable detection limit (10 µg/L) to a maximum of 6,900 µg/L with a 75th percentile of 503 µg/L and a mean value of 381 µg/L. Out of the 317 samples collected, there were 241 exceedances of the CWQG-FAL and PWQO (300 µg/L), 212 in the watercourses and 29 in the waterbodies. The 75th percentile values of both the watercourses and waterbodies exceed the CWQG-FAL and PWQO values and total iron is identified as a PoPC, and is anticipated to be a Policy 2 parameter (MOEE 1994). A seasonal pattern was observed with total iron peaking in March, then decreasing in the spring and increasing slightly during the summer and fall months (Figure 5.23). A similar seasonality trend was observed in each of the three watersheds, with the West Buskegau River watershed having slightly higher total iron concentrations than Jocko Creek and North Driftwood River watersheds in all months except April and May. The West Buskegau River watershed had overall higher concentrations of total iron with a 75th percentile of 1,075 µg/L. Jocko Creek and North Driftwood River watersheds had similar total iron concentrations, with a 75th percentile values of 580 µg/L and 644 µg/L, respectively.

Figure 5.23 Seasonal Variation of Total Iron All Project Site Monitoring Locations and by Watershed



Total lead concentrations ranged from below the RDL (0.1 µg/L) to a maximum of 5.56 µg/L with a 75th percentile of 0.54 µg/L and mean value of 0.43 µg/L in watercourses. In waterbodies, total lead ranged from below the RDL to a maximum of 0.742 µg/L with a 75th percentile value of 0.249 µg/L and mean of 0.174 µg/L. There were eight exceedances of the lead guideline values in watercourses out of 242 samples. Lead concentrations were observed to be higher in the winter months and lower in spring through fall. Jocko Creek and West Buskegau River watersheds had similar concentrations of total lead with a 75th percentile of 0.50 µg/L and 0.59 µg/L, respectively. The North Driftwood River watershed had slightly lower total lead concentrations, with a 75th percentile of 0.33 µg/L.

Dissolved manganese concentrations in watercourses ranged from 1.9 µg/L to 525.0 µg/L with a 75th percentile of 53.6 µg/L and mean value of 45.4 µg/L. In waterbodies, dissolved manganese ranged from 0.42 µg/L to 530 µg/L with a 75th percentile of 38 µg/L mean of 34 µg/L. There was one recorded CWQG-FAL exceedance in GERLK (Gerry Lake) in May 2023. Dissolved manganese concentrations were higher in the late fall to winter months and lower in spring to early fall for both watercourses and waterbodies. The North Driftwood River and West Buskegau River watersheds had similar concentrations of dissolved manganese with a 75th percentile of 51.1 µg/L and 59.2 µg/L, respectively. Jocko Creek watershed had slightly lower dissolved manganese concentrations, with a 75th percentile of 38.1 µg/L.

Trace mercury concentrations ranged from 0.25 ng/L to 10.80 ng/L in watercourses with a 75th percentile of 5.49 ng/L and mean value of 4.07 ng/L. In waterbodies, trace mercury concentrations ranged from 0.30 ng/L to 565 ng/L with a 75th percentile of 2.91 ng/L and mean value of 10.80 ng/L. When the maximum outlier of 565 ng/L in the waterbodies is removed, the mean value is 2.00 ng/L. There was one recorded exceedance of the CWQG-FAL (26 ng/L) in October 2023 in Sutherland Lake (SUTHLK), located in the North Driftwood River watershed, which is the outlier value. Trace mercury concentrations were observed to be slightly higher in the late winter and early spring months and lower during the summer and fall for both watercourses and waterbodies. Jocko Creek and North Driftwood River watersheds had similar concentrations of trace mercury with a 75th percentile of 4.91 ng/L and 3.45 ng/L, respectively. The West Buskegau River watershed had slightly higher trace mercury concentrations with a 75th percentile of 6.45 ng/L.

Methyl mercury results in watercourses and waterbodies had no exceedances of the CWQG-FAL value and the RDL was below the CWQG-FAL value.

Total zinc concentrations in watercourses ranged from 2 µg/L to a maximum of 54 µg/L with a 75th percentile of 7 µg/L and mean value of 8 µg/L. Total zinc concentrations in waterbodies ranged from below the RDL (1.0 µg/L) to a maximum of 33.7 µg/L with a 75th percentile value of 7 µg/L and mean value of 5.3 µg/L. Total zinc concentrations are compared to the PWQO lower limit of 20 µg/L, with seven exceedances recorded, five for watercourse locations and two for waterbody locations. Concentrations of total zinc were higher in the winter months and lower in the spring through fall. No substantial seasonal differences for total zinc were observed for the waterbody monitoring locations. The North Driftwood River and West Buskegau River watersheds had similar concentrations of total zinc with a 75th percentile of 7 µg/L and 8 µg/L, respectively. Jocko Creek watershed had slightly higher total iron concentrations, with a 75th percentile value of 10 µg/L.

Concentrations of other metals and metalloids including total antimony, arsenic, beryllium, boron, molybdenum, nickel, selenium, thallium, tungsten, uranium, and vanadium had no recorded exceedances of the applicable CWQG-FAL and PWQO values at the sampling locations with RDL values below the guideline values (Table 5.29).Total nickel, selenium, silver and zirconium in watercourses out of 242 samples had six or fewer exceedances of applicable guideline values with RDL values below the guideline values, and no guideline exceedances observed in waterbodies (Table 5.29).

Table 5.29 Summary of Metals and Metalloids Concentrations at Local Water Quality Monitoring Stations

5.3.2.4 Polycyclic Aromatic Hydrocarbons

Table 5.30 presents a summary of the laboratory analytical metal and metalloid results with complete analytical results provided in Appendix B.6.

Samples for polycyclic aromatic hydrocarbons (PAHs) analysis were collected in December 2023 at 12 watercourse monitoring locations and one waterbody location. The analyzed samples were below the RDL for the respective parameters. Due to the number of non-detect samples, no seasonal or watershed patterns could be observed. Several parameters have RDLs that are greater than the applicable PWQO criteria including anthracene, benzo(a)anthracene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, fluoranthene, and pyrene. It is our understanding that no commercial laboratory in Ontario has an approved method for the analysis of a number of PAHs in water which can achieve RDLs at or less than the PWQOs including anthracene, benzo(a)anthracene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene and fluoranthene.

Table 5.30 Summary of Polycyclic Aromatic Hydrocarbons at Local Water Quality Monitoring Stations

	Parameters	Units	RDL	CCME		PWQO	Minimum	Maximum	Mean	75th Percentile	95th Percentile	Std. Dev.	# of Samples	# of Non-detects	# of Exceedances

5.3.2.5 Parameters of Potential Concern

The following parameters were identified as PoPCs in the PA receiving waters due to 75th percentile exceedance of PWQO and/or CWQG-FAL criteria:

- **Total phosphorus** – Total phosphorus (TP) had a 75th percentile value of 0.033 mg/L for watercourses and 0.020 mg/L for waterbodies, exceeding the respective PWQO criteria of 0.030 mg/L for watercourses and 0.020 mg/L for waterbodies. Exceedances of the PWQO were more frequent in the winter and early spring months, with TP concentrations decreasing throughout the spring before increasingly slightly in the summer and fall months. Jocko Creek watershed had a 75th percentile of 0.023 mg/L for all monitoring sites within the watershed. The North Driftwood watershed had a 75th percentile of 0.027 mg/L. TP concentrations were higher in the West Buskegau watershed, with a 75th percentile of 0.037 mg/L. In the regional dataset, TP was also identified as a PoPC, with over 70% of the samples exceeding the PWQO.

- **Aluminum** – For the assessment of aluminum, CWQG-FAL criteria was used to evaluate total aluminum and PWQO criteria (clay-free samples) used to evaluate dissolved aluminum. The 75th percentile value for dissolved aluminum exceeded the PWQO criteria of 75 µg/L for the 0.2 µm filtered samples with 75th percentile value of 107 µg/L in watercourses. In waterbodies, dissolved aluminum concentrations had a 75th percentile of 43 µg/L (0.2 µm filter). Dissolved aluminum concentrations were observed to be slightly higher in the fall and early winter, with the West Buskegau River watershed experiencing more substantial variation. Jocko Creek and North Driftwood River watersheds had similar dissolved aluminum (0.2 µm) values, with a 75th percentile of 75 µg/L and 86 µg/L, respectively. The West Buskegau River watershed had higher dissolved aluminum concentrations, with a 75th percentile of 133 µg/L. Similarly, the regional data had high levels of aluminum, with a total aluminum 75th percentile of 270 µg/L with local PA watercourses having a 75th percentile concentration of 418 µg/L.

- **Total Iron** – Total iron had a 75th percentile value of 800 µg/L in watercourses and 503 µg/L in waterbodies, exceeding both the CWQG-FAL and PWQO of 300 µg/L. A seasonal pattern was observed with total iron peaking in March, then decreasing in the spring and increasing slightly during the summer and fall months. The 75th percentile of total iron exceeded the CWQG-FAL and PWQO criteria for each watershed. The West Buskegau River watershed had overall higher concentrations of total iron with a 75th percentile of 1,075 µg/L. Jocko Creek and North Driftwood River watersheds had similar total iron concentrations, with a 75th percentile of 580 µg/L and 644 µg/L, respectively. In the regional watercourse dataset, total iron concentrations similarly were identified as a PoPC with a 75th percentile of 690 µg/L with ocal watercourses in the PA having a 75th percentile concentration of 800 µg/L.

5.3.2.6 Patterns and Trends

Water quality analysis was conducted to understand patterns and trends by water feature type, watershed, and seasonally.

When aggregating the data by water feature type, specifically watercourses (including streams, rivers, and creeks) and waterbodies (lakes and ponds), concentrations of the analyzed nutrients as well as metals and metalloids were observed to be lower in waterbodies than watercourses, with less exceedances of the respective criteria.

A general seasonal trend was observed within the local water quality dataset. Concentrations of parameters (total ammonia (as N), DOC, TP, metals and metalloids) would often be higher in the late fall and winter months and lower in the spring and summer months. Distinct seasonality was more prevalent in the watercourse sampling locations and fewer seasonal patterns were observed in the waterbody monitoring locations. However, this lack of observed seasonality in waterbodies may be due to fewer waterbody samples collected and analyzed from 2021 and 2023, with 75 samples in waterbodies compared to 242 samples in watercourses.

Overall, there were no substantial and consistent differences between water quality in the three watersheds, Jocko Creek, North Driftwood River, and West Buskegau. The 75th percentile values for each parameter were comparable across the three watersheds. It is important to consider that any differences between the water feature type (watercourses vs. waterbodies) influences the analysis of watershed grouping depending on the prevalence of the water feature type. More specifically, Jocko Creek and West Buskegau River watersheds have only one waterbody monitoring location in each watershed, whereas 12 waterbodies (six lakes and six ponds) are located in the North Driftwood watershed.

5.3.2.7 Field Duplicates

Field precision was determined by calculating the RPD between the collected field data and its blind field duplicate. The data quality objective (DQO) for field precision was met when the RPD between replicates was consistently within 20% and values are greater than five times the detection RDL, which is based on the MECP “Protocol for Analytical Methods Used in Assessment Under Part XV.1 of the Environmental Protection Act” (MOE 2011b) and British Columbia Ministry of Environment Field Sampling Manual (2013). An RPD greater than 50% indicates a definite sample integrity problem; however, it is not unusual to find high variability for the field duplicates. Appendix B.10 presents parent and field duplicate data and RPD values.

A total of 22 field duplicates were collected across 15 monitoring stations (five waterbodies and ten watercourses). There was a total of seven reported RPD exceedances greater than 20% with values greater than five times the detection RDL in lakes and a subset of two above 50% for the June 3, 2022 GERLK sample, batch WT2205034 (total zinc, total methyl mercury), which were in the non-duplicate sample used in the assessment. There were a total of 39 RPD exceedances greater than 20% with values greater than five times the detection RDL in watercourses with a subset of 10 above 50%. The nine watercourse sample parameters with RPD values above 50% and guideline values included

dissolved barium (JCRK-03), total barium (WBR-S-04 [July 2023]), dissolved Al (KC-01 [February 2023]), MATR-02 [October 2022]), dissolved Mn (MATR-02 [October 2022]), total Zn (NDRS-04), dissolved molybdenum (NDRS-04b), total Cu (NDRS-06 [May 2023]), dissolved methyl mercury (NDRS06 [November 2023]), and acidity (WBR-S-07) with the dissolved Al and total Cu results exceeding the PWQO value and the other parameters being below CCME CWQG-FAL and PWQO values. For the waterbodies and watercourses the values greater than 50% for RPD were removed from the statistical assessment dataset.

5.3.3 Local and Regional Water Quality Comparison

When comparing the local and regional water quality data, there are overall similarities for seasonal patterns as well as a number of PoPCs. Comparisons of water feature types between local and regional data were not possible as the six regional PWQMN monitoring stations are watercourses.

Both the regional and local water quality exhibited seasonal trends for a number of parameters. Concentrations of select parameters (total ammonium/total ammonia (as N), TP, aluminum, iron, lead, and zinc) would often be higher in the late fall and winter months and lower in the spring and summer months. The seasonality trends observed in the local water quality dataset, particularly the watercourse monitoring locations, were typically more distinct for a number of metals and metalloids compared to the regional data set.

Total phosphorous, dissolved (0.2 µm) and total aluminum and total iron, are considered PoPCs in both the local and regional water quality datasets, as discussed in Section 5.3.2.5. Additional PoPCs were identified in regional dataset, however were not considered PoPCs in the local data, including total arsenic, total cadmium, total cobalt, total copper, total lead, total silver and total zinc. The regional total arsenic watercourse 75th percentile concentration was 9 µg/L and 1 µg/L for local watercourses. Total cadmium in the regional data had a 75th percentile of 0.75 µg/L, exceeding both the PWQO of 0.2 µg/L and hardness dependent interim PWQO of 0.5 µg/L. In comparison, the local data had a 75th percentile of 0.042 µg/L in watercourses and over 50% of the samples in waterbodies were below the RDL (<0.005 µg/L). Total cobalt for the local watercourses had a 75th percentile value of 0.3 µg/L and 4.9 µg/L for regional watercourses. The regional data for total copper had a 75th percentile of 14.8 µg/L, exceeding both the PWQO of 5 µg/L and hardness dependent interim PWQO of 5 µg/L, whereas the local water quality data had a 75th percentile of 2.0 µg/L and did not exceed the criteria. The regional lead data had high fluctuations in RDL values that exceeded the CWQG-FAL and PWQO values with 152 of 191 observed concentrations exceeding the guideline values, and the local watercourse had a 75th percentile value of 0.54 µg/L. For total zinc, the regional data had a 75th percentile of 30 µg/L, which exceeds the PWQO lower limit of 20 µg/L. Comparatively, the local data had a 75th percentile of 8 µg/L for total zinc and was not considered to be a PoPC.

To understand the range of natural variability of water quality, a 95th percentile value was calculated for both the local and regional datasets, and a 5th percentile value for pH and dissolved oxygen which have lower limit guidelines. Greater variability was typically present in the regional dataset for general chemistry, nutrient, and metal and metalloid parameters, potentially due to the longer monitoring period. Total aluminum, TSS and DOC had higher 95th percentile local watercourse values than the regional dataset, but were the same order of magnitude. The natural variability of the regional water quality data captured the observed results of the local water quality data.

6 Summary and Conclusions

This report describes the climate, hydrology and water quality conditions in the watersheds potentially affected by the proposed project. Field work and desktop analyses were conducted.

Field work included the hydrometric monitoring program, conducted by WSP Golder, Stantec and Canada Nickel staff. A total of 6 stations were monitored for stage and discharge in 2021 with two field assessments, 10 sites in 2022 (one of which is a lake station to monitor stage) with quarterly monitoring when available, and 10 sites in 2023 (one of which is a lake station to monitor stage) with monthly monitoring when safe to do so. Solinst Leveloggers® are installed at each station to monitor continuous water levels. Manual flow measurements under wadable conditions were conducted using either a Marsh-McBirney Flo-Mate 2000 with a topset wading rod or a FlowTracker2 (2021 to 2022). In 2023, all wadable flow measurements were captured with a FlowTracker2. During high flow events. Either the Sontek M9 current profiler or the USGS Type AA Current Meter were utilized for data collection (2021 to 2022). In 2023, only the Sontek M9 is used during high flow events.

Desktop analysis included a climate and climate change assessment, a regional hydrological assessment, an environmental water balance and the development of a hydrological model. The climate and climate change assessment characterized temperature, rainfall, and snowfall at the site and into the future of the site. The regional assessment provided regression equations that allowed for the determination of mean annual water flows, monthly flows, peak flows, IDFs, baseflows and runoff coefficients, and flow duration curves.

To analyze and describe water quality conditions in the Project Area, a regional and local water quality assessment was conducted. Regional water quality data was obtained from seven monitoring stations in the PWQMN. Local water quality samples were collected from 2021 to 2023 by WSP Golder (2021, 2022, 2023) and Canada Nickel staff (2023) at a total of 33 watercourse locations and 13 waterbody locations across three main watersheds, Jocko Creek, North Driftwood River, and West Buskegau River watersheds. To facilitate data analysis and discussion, results were assessed by grouping monitoring stations located in waterbodies and watercourses. Monitoring locations were also aggregated by watershed and were assessed for water quality relationships of water feature type, watershed, and seasonality.

6.1 Hydrology

The information presented in this baseline report is intended to summarize the existing hydrologic conditions relevant to the Project in support of preparation of the Impact Statement with the following conclusions:

- General site topography is relatively flat, with an average topographic slope of 1.7%. Channel slope of the watersheds range between 0.05% – 0.11%. The site area is primarily covered by mixed and coniferous forests, and approximately a quarter of the area is comprised of swamps and bogs.

- Three major watersheds make up the study area. The Jocko Creek watershed was determined to have a total area of 109.6 km^2 draining to the Mattagami River. The North Driftwood River watershed has a total area of 383.3 km^2. Lastly the West Buskegau River watershed is found to be 524.1km^2. The West Buskegau and North Driftwood watersheds drain to the Abitibi River. All rivers ultimately confluence with the Moose River with an ultimate discharge into James Bay
- Local water users include a record of more than 60 groundwater wells, and an OPG operated hydroelectric dam on the Mattagami River downstream from the Project site on Jocko Creek.
- Based on the developed 1991 – 2020 climate normal using an ensemble of ECCC climate station data from Timmins, ON, climate normal temperatures ranged from -16.4ºC in January to 17.6ºC in July with an annual average of 2.0°C. Temperatures drop below freezing in November and remain in freezing through March. The annual climate normal period total precipitation is 801.8 mm with a monthly high total precipitation of 86.1 mm during October. Based on the 1981 – 2010 climate normal, snow is typically present from November until May, with on average greatest snow depths in February (64 cm) and average minimal amount of snow in May (1 cm)
- Climate change predictions for the 2071 – 2100 period to capture the project temporal scale for the SSP2-4.5 emission scenario estimated an average annual temperature increase of +3.7ºC, with a +5.3ºC increase during winter months (January – March) relative to the 1971-2000 climate normal. The 2071 – 2100 SSP2-4.5 emission scenario climate normal annual total precipitation is estimated to be 914.5 mm.
  - The climate adjusted IDF curves estimated precipitation amounts for storms of various durations and event return periods to increase by an average of 22.7% for the SSP2-4.5 emissions scenario for the 2071 – 2100 time period.
- A regional hydrological assessment was performed to assist in the development of hydrological relationships for understanding flows and hydrology at the Project site.
  - The baseflow index was calculated for each WSC station with an annual regional average of 30%, increasing to 59% during winter months. Runoff coefficient for the regional station sites ranged from 0.38 – 0.51.
  - Flows typically peak in May and are at the lowest in February.
  - Regression relationships for determining flood flows by catchment area size were developed with coefficient of determination values ranging from 0.76 to 0.82.
  - Low and environmental flows were characterized using the Tessman method. The 30% MAD was estimated for each of the Project watersheds.

- An environmental water balance for the PA using the USGS Thornthwaite methods was developed for 1991-2020 climate normal, wettest recorded year and driest recorded year. The climate normal, driest and wettest year annual actual evapotranspiration is estimated to be 473 mm, 453 mm and 510 mm, respectively. The climate normal total groundwater recharge (infiltration) estimated for the project site is 164.1 mm/year, which is 28.7% of the total precipitation amount. The climate normal total stream flow estimate of 328.2 mm represents a streamflow (runoff) coefficient of 41%.

- Hydrometric monitoring was conducted from 2021 to 2023 at 11 stations, including two stations performing lake level monitoring. *In situ* flow measurement results, rating curves, and station hydrographs for each applicable station were developed and presented. Hydrometric flow station watershed areas ranged from 7.2 to 199 km^2. A minimum of four ice-free condition *in situ* flow measurements were used to develop rating curves at seven of the nine watercourse hydrometric stations. The data collected allowed for the development of station specific rating curves at seven flow monitoring stations (except for SW-1 and SW-3).

- Bathymetric assessments were conducted on site specific lakes. Mean depth of site lakes ranges between 2.5 m and 7.9 m below water surface. Maximum site lake depths range between 11.0 m and 22.0 m below water surface.

- The development of hydrological model (HEC-HMS) of the three site watersheds was developed and calibrated using prorated flows from a nearby WSC HYDAT station (Porcupine River at Hoyle, # 04MD004). The developed model was able to represent baseflows, spring freshet flow peaks, and adequately represented precipitation events recorded.

6.2 Surface Water Quality

The information presented in this baseline report is intended to summarize the existing surface water quality conditions relevant to the Project in support of preparation of the Impact Statement with the following conclusions:

- Three parameters were identified as Project Area parameters of potential concern (PoPCs) where 75th percentile values exceed the corresponding PWQO and/or CWQG-FAL guideline. Total phosphorus (TP) had a 75th percentile value of 0.032 mg/L for watercourses and 0.021 mg/L for waterbodies. PWQO values for TP are 0.033 mg/L and 0.020 mg/L for watercourses and waterbodies, respectively and was therefore identified as a PoPC. For the assessment of aluminum, CWQG-FAL criteria was used to evaluate total aluminum and PWQO criteria (clay-free samples) used to evaluate dissolved aluminum. The 75th percentile value for dissolved aluminum exceeded the PWQO criteria of 75 µg/L for the 0.2 µm filtered samples with a value of 107 µg/L, respectively in watercourses. Total iron is identified as a PoPC as the 75th percentile values of both the watercourses and waterbodies exceed the CWQG-FAL and PWQO of 300 µg/L.

- Other metals and metalloids that reported at least one exceedance of the applicable guideline values as part of the local watercourse and waterbody monitoring program include: total cadmium, total cobalt, total copper, total lead, dissolved manganese, mercury, total selenium, total silver, total zinc and total zirconium.
- Regional water quality data identified additional PoPCs that were not observed in the local data and are not considered PoPCs in the Project Area were total arsenic, total cadmium, total cobalt, total copper, total lead, total silver and total zinc.
- Local general water quality in the watercourses and waterbodies identified slightly acidic conditions with 25th percentile values below the CWQG-FAL and PWQO lower limit (6.5). Alkalinity is relatively low with limited acid buffering potential. Waters within the Project Area are typically classified as medium hard with soft waters in the Jocko Creek and West Buskegau watersheds.
- Overall, there were no substantial and consistent differences between the three watersheds, Jocko Creek, North Driftwood River, and West Buskegau, with each watershed having comparable 75th percentile values for the analyzed parameters.
- When aggregating the data by water feature type, specifically watercourses (including streams, rivers, and creeks) and waterbodies (lakes and ponds), concentrations of the analyzed nutrients, metals and metalloids were observed to be lower in waterbodies than watercourses, with fewer exceedances of the respective guidelines.
- Both the regional and local water quality exhibited seasonal trends for various parameters. Concentrations of parameters were typically higher in the late fall and winter months and lower in the spring and summer months (total ammonium/total ammonia (as N), TP, aluminum, iron, lead and zinc). A slightly more distinct seasonality was observed in the local water quality dataset, particularly the watercourse monitoring locations and for additional metals and metalloids.
- Greater variability was generally present in the regional dataset 95th percentile value and 5th percentile value for dissolved oxygen and pH, potentially due to the longer sampling period. Total aluminum, TSS and DOC had higher 95th percentile local watercourse values than the regional dataset, but were the same order of magnitude. The natural variability of the regional water quality data captured the observed results of the local water quality data.
- Six lakes had temperature and dissolved oxygen profiles measured at regular intervals and during the summer and early fall months in 2022 to 2023, which were observed to be thermally stratified with low oxygen to anoxic hypolimnions.

Minimum Flow (m^3/s)	0.07	0.10
Maximum Flow (m^3/s)	27.8	24.2

Table B1.5 North Driftwood Watershed HEC-HMS Model Calibration Statistics for the Period of January 1, 2008 to December 31, 2014

Statistical Parameter	Prorated Porcupine Station	Model Result
Nash-Sutcliffe Efficiency	-	0.52
RMSE	-	6.99
R^2	-	0.54
Mean Flow (m^3/s)	5.08	4.62
Minimum Flow (m^3/s)	0.26	0.40
Maximum Flow (m^3/s)	96.7	107.9

Table B1.6 West Buskegau Watershed HEC-HMS Model Calibration Statistics for the Period of January 1, 2008 to December 31, 2014

Statistical Parameter	Prorated Porcupine Station	Model Result
Nash-Sutcliffe Efficiency	-	0.46
RMSE	-	9.11
R^2	-	0.60
Mean Flow (m^3/s)	6.95	6.18
Minimum Flow (m^3/s)	0.36	0.50
Maximum Flow (m^3/s)	132.3	154.9

Appendix B.2 Hydrometric Monitoring Summary Sheets

Hydrometric Monitoring Station SW-1 Summary			
Station ID	SW-1	**Instrument**	Solinst Levelogger®
Location	North Driftwood	**Measurements**	Continuous levellogger (level and temperature)
Installation Date	July 2021	**Spot Measurements**	Flow, Stage
GPS Coordinates	48°48'43"N 81°22'33"W	**Main Channel**	Culvert - Corrugated Steel Pipe (CSP)
Access	Route 655, access road	**Channel Bottom**	Upstream: North Driftwood tributary, ponded area; Downstream: North Driftwood River confluence, backwater
Drainage Area	7.2 km^2	**Flood Plain**	CSP Culvert
Period of Record	July 2021 - ongoing	**Comments**	Manual Flow Measurements - Culvert outlet; Continuous Water Levels - upstream from Culvert inlet; regular partial damming of culvert inlet with mud and woody debris
Active	Yes		

Map: SW-1 OWIT Drainage Area (MNRF 2023a)

Drainage Area (km^2)	7.201
Shape Factor ()	5.846
Length of Main Channel (km)	6.488
Maximum Channel Elevation (m)	290.630
Minimum Channel Elevation (m)	265.560
Slope of Main Channel (m/km)	3.860
Slope of Main Channel (%)	0.386
Area Lakes/Wetlands (km^2)	0.070
Area - Lakes (km^2)	0.000
Area - Wetlands (km^2)	0.070
Mean Elevation (m)	279.406
Maximum Elevation (m)	294.223
Mean Slope (%)	0.816
Annual Mean Temperature (°C)	1.900
Annual Precipitation (mm)	852.000

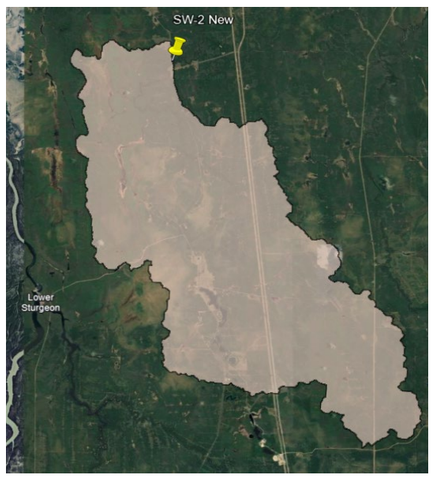
Hydrometric Monitoring Station SW-2b Summary			
Station ID	SW-2b	**Instrument**	Solinst Levelogger®
Location	North Driftwood	**Measurements**	Continuous levellogger (level and temperature)
Installation Date	April 2022	**Spot Measurements**	Flow, Stage
GPS Coordinates	48°53'57"N 81°25'03"W	**Main Channel**	Straight
Access	Route 655, access road	**Channel Bottom**	Cobbles, gravel
Drainage Area	105 km^2	**Flood Plain**	Left bank: grasses, confierous trees. Reight bank: vegetation, steep slope
Period of Record	April 2022 - Ongoing	**Comments**	Manual Flow Measurements - 8 m downstream of bridge
Active	Yes		



Map: SW-2b OWIT Drainage Area (MNRF 2023a)

Drainage Area (km^2)	105.242
Shape Factor ()	10.056
Length of Main Channel (km)	32.531
Maximum Channel Elevation (m)	299.360
Minimum Channel Elevation (m)	259.020
Slope of Main Channel (m/km)	1.240
Slope of Main Channel (%)	0.124
Area Lakes/Wetlands (km^2)	4.962
Area - Lakes (km^2)	0.653
Area - Wetlands (km^2)	4.308
Mean Elevation (m)	275.013
Maximum Elevation (m)	303.137
Mean Slope (%)	1.075
Annual Mean Temperature (°C)	1.800
Annual Precipitation (mm)	853.000

Summary of Surface Water Analytical Data - 19006404502
Crawford Project Preliminary Water Quality Assessment
Canadian Nickel Company

Notes:

CCME	Canadian Council of Ministers of the Environment
A	Canadian Environmental Quality Guidelines, Canadian Water Quality Guidelines for the Protection of Aquatic Life - Freshwater Aquatics Short Term
B	Canadian Environmental Quality Guidelines, Canadian Water Quality Guidelines for the Protection of Aquatic Life - Freshwater Aquatics Long Term
PWQO	Provincial Water Quality Objectives of the Ministry of Environment and Energy (MOEE, 1999)
C	PWQO Table 2
D	PWQO Table 2 - Calculated
E	PWQO Table 2 - Interim
6.5[A]	Concentration exceeds the indicated standard.
15.2	Measured concentration did not exceed the indicated standard.
<0.50	Laboratory reporting limit was greater than the applicable standard.
<0.03	Analyte was not detected at a concentration greater than the laboratory reporting limit.
n/v	No standard/guideline value.
-	Parameter not analyzed / not available.
EQ1	The short-term benchmark is for dissolved zinc and is calculated using the following equation: Benchmark = exp(0.833[ln(hardness mg·L-1)] + 0.240[ln(DOC mg·L-1)] + 0.526). The value in the table is for surface water of 50 mg CaCO3·L−1 hardness and 0.5 mg·L−1 dissolved organic carbon (DOC).
	The benchmark equation is valid between hardness 13.8 and 250.5 mg CaCO3·L−1 and DOC 0.3 and 17.3 mg·L−1.
EQ2	The long-term CWQG is for dissolved zinc and is calculated using the following equation: CWQG = exp(0.947[ln(hardness mg·L-1)] - 0.815[pH] + 0.398[ln(DOC mg·L-1)] + 4.625). The value in the table is for surface water of 50 mg CaCO3·L−1 hardness, pH of 7.5 and 0.5 mg·L−1 DOC.
	The CWQG equation is valid between hardness 23.4 and 399 mg CaCO3·L−1, pH 6.5 and 8.13 and DOC 0.3 to 22.9 mg·L−1.
EQ3	The short-term benchmark is calculated using the benchmark calculator in Appendix B of the Scientific Criteria Document for the Development of the Canadian Water Quality Guidelines for the Protection of Aquatic Life: Manganese or the following equation:
	Benchmark = exp(0.878[ln(hardness)] + 4.76) where the benchmark is expressed in dissolved manganese concentration (µg/L), and hardness is measured as CaCO3 equivalents in mg/L. The value in the table is for surface water of 50 mg/L hardness. The benchmark equation is valid between hardness 25 and 250 mg/L.
EQ4	The long-term CWQG is found using the look-up table (see Table 5) or the CWQG and benchmark calculator is Appendix B of CCME (2019). The value in the table is for surface water of 50 mg/L hardness and pH of 7.5. The CWQG table is valid between hardness 25 and 670 mg/L and pH 5.8 and 8.4.
LTG	The CWQG for cadmium (i.e. long-term guideline) of 0.09 µg·L-1 is for waters of 50 mg CaCO3·L-1 hardness. The CWQG for cadmium is related to water hardness (as CaCO3): When the water hardness is > 0 to < 17 mg/L, the CWQG is 0.04 µg/L; at hardness ≥ 17 to ≤ 280 mg/L, the CWQG is calculated using this equation (CWQG (µg/L) = 10^{0.83(log[hardness]) – 2.46 });
	At hardness > 280 mg/L, the CWQG is 0.37 µg/L.
n1	Guideline is expressed as Nitrite (as N) in ug/L. This value is equivalent to 197 ug/L for Nitrite.
s3	The PWQO for beryllium is hardness dependent. If hardness <75 mg/L than PWQO is 0.011 mg/L. For hardness > 75 mg/L, PWQO is 1.1 mg/L.
s2	Sulphate Guideline is hardness dependent. For hardness between 0-30 mg/L, guideline is 128 mg/L. For hardness between 31-75 mg/L, guideline is 218 mg/L. For hardness between 76-180 mg/L, guideline is 309 mg/L. For hardness between 181-250 mg/L, guideline is 429 mg/L. For hardness >250 mg/L, guideline is determined on a site specific basis.
	For hardness >250 mg/L and no site specific criteria is available, sampled were flagged as exceeding above 430mg/L.
s4	Applies to Phosphorus, total. PWQO is 0.03 mg/L for rivers and streams, 0.02 mg/L for lakes, and 0.01 mg/L for lakes naturally below this value.
s9	The PWQO for dissolved oxygen is both temperature and biota dependent. See page 17 of MOE (1994).
s12	The interim PWQO for cadmium is hardness dependent. If hardness <100 mg/L than PWQO is 0.0001 mg/L. For hardness >100 mg/L, PWQO is 0.0005 mg/L.
s13	The interim PWQO for copper is hardness dependent. If hardness <20 mg/L than PWQO is 0.001 mg/L. For hardness >20 mg/L, PWQO is 0.005 mg/L.
s14	PWQO for lead is alkalinity dependent. For alkalinity <20 mg/L, PWQO is 0.005 mg/L. For alkalinity between 20-40 mg/L, PWQO is 0.01 mg/L. For alkalinity between 40-80 mg/L, PWQO is 0.02 mg/L. For alkalinity >80 mg/L, PWQO is 0.025 mg/L.
s15	Interim PWQO for lead is hardness dependent. For hardness <30 mg/L, interim PWQO is 0.001 mg/L. For hardness between 30-80 mg/L, interim PWQO is 0.003 mg/L. For hardness >80 mg/L, interim PWQO is 0.005 mg/L.
s16	Alkalinity should not be decreased by more than 25% of the natural concentration.
STB	The short-term benchmark concentration of 1.0 µg·L-1 is for waters of 50 mg CaCO3·L-1 hardness. The short-term benchmark for cadmium is related to water hardness (as CaCO3): When the water hardness is 0 to < 5.3 mg/L, the short-term benchmark is 0.11 µg/L,
	At hardness ≥ 5.3 to ≤ 360 mg/L, the short-term benchmark is calculated using this equation (Short-term benchmark (µg/L) = 10^{1.016[log[hardness]) – 1.71 });
TBC1	Value is minimum value available. Sample-specific value to be calculated (equation).
VAR	Lowest acceptable dissolved oxygen concentration: for warm water biota: early life stages = 6000 µg/L; for warm water biota: other life stages = 5500 µg/L; for cold water biota: early life stages = 9500 µg/L; for cold water biota: other life stages = 6500 µg/L
VAR1	Variable, 5 µg/L if pH < 6.5 and 100 µg/L if pH > 6.5
*	The CWQG for copper is related to water hardness. When the water hardness is 0 to < 82 mg/L, the CWQG is 2 µg/L. At hardness ≥82 to ≤180 mg/L the CWQG is calculated using this equation:
	CWQG (µg/L) = 0.2 * e{0.8545[ln(hardness)]-1.465}. At hardness >180 mg/L, the CWQG is 4 µg/L. If the hardness is unknown, the CWQG is 2 µg/L
#	The CWQG for lead is related to water hardness. When the hardness is 0 to ≤ 60 mg/L, the CWQG is 1 µg/L. At hardness >60 to ≤ 180 mg/L the CWQG is calculated using this equation:
	CWQG (µg/L)= e{1.273[ln(hardness)]-4.705}. At hardness >180 mg/L, the CWQG is 7 µg/L. If the hardness is unknown, the CWQG is 1 µg/L
**	The CWQG for nickel is related to water hardness. When the water hardness is 0 to ≤ 60 mg/L, the CWQG is 25 µg/L. At hardness > 60 to ≤ 180 mg/L the CWQG is calculated using this equation:
	CWQG (µg/L) = e{0.76[ln(hardness)]+1.06}. At hardness >180 mg/L, the CWQG is 150 µg/L. If the hardness is unknown, the CWQG is 25 µg/L

<0.03	Analyte was not detected at a concentration greater than the laboratory reporting limit.
n/v	No standard/guideline value.
-	Parameter not analyzed / not available.
EQ1	The short-term benchmark is for dissolved zinc and is calculated using the following equation: Benchmark = exp(0.833[ln(hardness mg·L-1)] + 0.240[ln(DOC mg·L-1)] + 0.526). The value in the table is for surface water of 50 mg CaCO3·L−1 hardness and 0.5 mg·L−1 dissolved organic carbon (DOC).
	The benchmark equation is valid between hardness 13.8 and 250.5 mg CaCO3·L−1 and DOC 0.3 and 17.3 mg·L−1.
EQ2	The long-term CWQG is for dissolved zinc and is calculated using the following equation: CWQG = exp(0.947[ln(hardness mg·L-1)] - 0.815[pH] + 0.398[ln(DOC mg·L-1)] + 4.625). The value in the table is for surface water of 50 mg CaCO3·L−1 hardness, pH of 7.5 and 0.5 mg·L−1 DOC.
	The CWQG equation is valid between hardness 23.4 and 399 mg CaCO3·L−1, pH 6.5 and 8.13 and DOC 0.3 to 22.9 mg·L−1.
EQ3	The short-term benchmark is calculated using the benchmark calculator in Appendix B of the Scientific Criteria Document for the Development of the Canadian Water Quality Guidelines for the Protection of Aquatic Life: Manganese or the following equation:
	Benchmark = exp(0.878[ln(hardness)] + 4.76) where the benchmark is expressed in dissolved manganese concentration (µg/L), and hardness is measured as CaCO3 equivalents in mg/L. The value in the table is for surface water of 50 mg/L hardness. The benchmark equation is valid between hardness 25 and 250 mg/L.
EQ4	The long-term CWQG is found using the look-up table (see Table 5) or the CWQG and benchmark calculator is Appendix B of CCME (2019). The value in the table is for surface water of 50 mg/L hardness and pH of 7.5. The CWQG table is valid between hardness 25 and 670 mg/L and pH 5.8 and 8.4.
LTG	The CWQG for cadmium (i.e. long-term guideline) of 0.09 µg·L-1 is for waters of 50 mg CaCO3·L-1 hardness. The CWQG for cadmium is related to water hardness (as CaCO3): When the water hardness is > 0 to < 17 mg/L, the CWQG is 0.04 µg/L; at hardness ≥ 17 to ≤ 280 mg/L, the CWQG is calculated using this equation (CWQG (µg/L) = 10^{0.83(log[hardness]) – 2.46 });
	At hardness > 280 mg/L, the CWQG is 0.37 µg/L.
n1	Guideline is expressed as Nitrite (as N) in ug/L. This value is equivalent to 197 ug/L for Nitrite.
s3	The PWQO for beryllium is hardness dependent. If hardness <75 mg/L than PWQO is 0.011 mg/L. For hardness > 75 mg/L, PWQO is 1.1 mg/L.
s2	Sulphate Guideline is hardness dependent. For hardness between 0-30 mg/L, guideline is 128 mg/L. For hardness between 31-75 mg/L, guideline is 218 mg/L. For hardness between 76-180 mg/L, guideline is 309 mg/L. For hardness between 181-250 mg/L, guideline is 429 mg/L. For hardness >250 mg/L, guideline is determined on a site specific basis.
	For hardness >250 mg/L and no site specific criteria is available, sampled were flagged as exceeding above 430mg/L.
s4	Applies to Phosphorus, total. PWQO is 0.03 mg/L for rivers and streams, 0.02 mg/L for lakes, and 0.01 mg/L for lakes naturally below this value.
s9	The PWQO for dissolved oxygen is both temperature and biota dependent. See page 17 of MOE (1994).
s12	The interim PWQO for cadmium is hardness dependent. If hardness <100 mg/L than PWQO is 0.0001 mg/L. For hardness >100 mg/L, PWQO is 0.0005 mg/L.
s13	The interim PWQO for copper is hardness dependent. If hardness <20 mg/L than PWQO is 0.001 mg/L. For hardness >20 mg/L, PWQO is 0.005 mg/L.
s14	PWQO for lead is alkalinity dependent. For alkalinity <20 mg/L, PWQO is 0.005 mg/L. For alkalinity between 20-40 mg/L, PWQO is 0.01 mg/L. For alkalinity between 40-80 mg/L, PWQO is 0.02 mg/L. For alkalinity >80 mg/L, PWQO is 0.025 mg/L.
s15	Interim PWQO for lead is hardness dependent. For hardness <30 mg/L, interim PWQO is 0.001 mg/L. For hardness between 30-80 mg/L, interim PWQO is 0.003 mg/L. For hardness >80 mg/L, interim PWQO is 0.005 mg/L.
s16	Alkalinity should not be decreased by more than 25% of the natural concentration.
STB	The short-term benchmark concentration of 1.0 µg·L-1 is for waters of 50 mg CaCO3·L-1 hardness. The short-term benchmark for cadmium is related to water hardness (as CaCO3): When the water hardness is 0 to < 5.3 mg/L, the short-term benchmark is 0.11 µg/L,
	At hardness ≥ 5.3 to ≤ 360 mg/L, the short-term benchmark is calculated using this equation (Short-term benchmark (µg/L) = 10^{1.016[log[hardness]) – 1.71 });
TBC1	Value is minimum value available. Sample-specific value to be calculated (equation).
VAR	Lowest acceptable dissolved oxygen concentration: for warm water biota: early life stages = 6000 µg/L; for warm water biota: other life stages = 5500 µg/L; for cold water biota: early life stages = 9500 µg/L; for cold water biota: other life stages = 6500 µg/L

EQ1	The short-term benchmark is for dissolved zinc and is calculated using the following equation: Benchmark = exp(0.833[ln(hardness mg·L-1)] + 0.240[ln(DOC mg·L-1)] + 0.526). The value in the table is for surface water of 50 mg CaCO3·L−1 hardness and 0.5 mg·L−1 dissolved organic carbon (DOC).
	The benchmark equation is valid between hardness 13.8 and 250.5 mg CaCO3·L−1 and DOC 0.3 and 17.3 mg·L−1.
EQ2	The long-term CWQG is for dissolved zinc and is calculated using the following equation: CWQG = exp(0.947[ln(hardness mg·L-1)] - 0.815[pH] + 0.398[ln(DOC mg·L-1)] + 4.625). The value in the table is for surface water of 50 mg CaCO3·L−1 hardness, pH of 7.5 and 0.5 mg·L−1 DOC.
	The CWQG equation is valid between hardness 23.4 and 399 mg CaCO3·L−1, pH 6.5 and 8.13 and DOC 0.3 to 22.9 mg·L−1.
EQ3	The short-term benchmark is calculated using the benchmark calculator in Appendix B of the Scientific Criteria Document for the Development of the Canadian Water Quality Guidelines for the Protection of Aquatic Life: Manganese or the following equation:
	Benchmark = exp(0.878[ln(hardness)] + 4.76) where the benchmark is expressed in dissolved manganese concentration (µg/L), and hardness is measured as CaCO3 equivalents in mg/L. The value in the table is for surface water of 50 mg/L hardness. The benchmark equation is valid between hardness 25 and 250 mg/L.
EQ4	The long-term CWQG is found using the look-up table (see Table 5) or the CWQG and benchmark calculator is Appendix B of CCME (2019). The value in the table is for surface water of 50 mg/L hardness and pH of 7.5. The CWQG table is valid between hardness 25 and 670 mg/L and pH 5.8 and 8.4.
LTG	The CWQG for cadmium (i.e. long-term guideline) of 0.09 µg·L-1 is for waters of 50 mg CaCO3·L-1 hardness. The CWQG for cadmium is related to water hardness (as CaCO3): When the water hardness is > 0 to < 17 mg/L, the CWQG is 0.04 µg/L; at hardness ≥ 17 to ≤ 280 mg/L, the CWQG is calculated using this equation (CWQG (µg/L) = 10^{0.83(log[hardness]) – 2.46 });
	At hardness > 280 mg/L, the CWQG is 0.37 µg/L.
n1	Guideline is expressed as Nitrite (as N) in ug/L. This value is equivalent to 197 ug/L for Nitrite.
s3	The PWQO for beryllium is hardness dependent. If hardness <75 mg/L than PWQO is 0.011 mg/L. For hardness > 75 mg/L, PWQO is 1.1 mg/L.
s2	Sulphate Guideline is hardness dependent. For hardness between 0-30 mg/L, guideline is 128 mg/L. For hardness between 31-75 mg/L, guideline is 218 mg/L. For hardness between 76-180 mg/L, guideline is 309 mg/L. For hardness between 181-250 mg/L, guideline is 429 mg/L. For hardness >250 mg/L, guideline is determined on a site specific basis.
	For hardness >250 mg/L and no site specific criteria is available, sampled were flagged as exceeding above 430mg/L.
s4	Applies to Phosphorus, total. PWQO is 0.03 mg/L for rivers and streams, 0.02 mg/L for lakes, and 0.01 mg/L for lakes naturally below this value.
s9	The PWQO for dissolved oxygen is both temperature and biota dependent. See page 17 of MOE (1994).
s12	The interim PWQO for cadmium is hardness dependent. If hardness <100 mg/L than PWQO is 0.0001 mg/L. For hardness >100 mg/L, PWQO is 0.0005 mg/L.
s13	The interim PWQO for copper is hardness dependent. If hardness <20 mg/L than PWQO is 0.001 mg/L. For hardness >20 mg/L, PWQO is 0.005 mg/L.
s14	PWQO for lead is alkalinity dependent. For alkalinity <20 mg/L, PWQO is 0.005 mg/L. For alkalinity between 20-40 mg/L, PWQO is 0.01 mg/L. For alkalinity between 40-80 mg/L, PWQO is 0.02 mg/L. For alkalinity >80 mg/L, PWQO is 0.025 mg/L.
s15	Interim PWQO for lead is hardness dependent. For hardness <30 mg/L, interim PWQO is 0.001 mg/L. For hardness between 30-80 mg/L, interim PWQO is 0.003 mg/L. For hardness >80 mg/L, interim PWQO is 0.005 mg/L.
s16	Alkalinity should not be decreased by more than 25% of the natural concentration.
STB	The short-term benchmark concentration of 1.0 µg·L-1 is for waters of 50 mg CaCO3·L-1 hardness. The short-term benchmark for cadmium is related to water hardness (as CaCO3): When the water hardness is 0 to < 5.3 mg/L, the short-term benchmark is 0.11 µg/L,
	At hardness ≥ 5.3 to ≤ 360 mg/L, the short-term benchmark is calculated using this equation (Short-term benchmark (µg/L) = 10^{1.016[log[hardness]) – 1.71 });
TBC1	Value is minimum value available. Sample-specific value to be calculated (equation).
VAR	Lowest acceptable dissolved oxygen concentration: for warm water biota: early life stages = 6000 µg/L; for warm water biota: other life stages = 5500 µg/L; for cold water biota: early life stages = 9500 µg/L; for cold water biota: other life stages = 6500 µg/L
VAR1	Variable, 5 µg/L if pH < 6.5 and 100 µg/L if pH > 6.5
*	The CWQG for copper is related to water hardness. When the water hardness is 0 to < 82 mg/L, the CWQG is 2 µg/L. At hardness ≥82 to ≤180 mg/L the CWQG is calculated using this equation:
	CWQG (µg/L) = 0.2 * e{0.8545[ln(hardness)]-1.465}. At hardness >180 mg/L, the CWQG is 4 µg/L. If the hardness is unknown, the CWQG is 2 µg/L
#	The CWQG for lead is related to water hardness. When the hardness is 0 to ≤ 60 mg/L, the CWQG is 1 µg/L. At hardness >60 to ≤ 180 mg/L the CWQG is calculated using this equation:
	CWQG (µg/L)= e{1.273[ln(hardness)]-4.705}. At hardness >180 mg/L, the CWQG is 7 µg/L. If the hardness is unknown, the CWQG is 1 µg/L
**	The CWQG for nickel is related to water hardness. When the water hardness is 0 to ≤ 60 mg/L, the CWQG is 25 µg/L. At hardness > 60 to ≤ 180 mg/L the CWQG is calculated using this equation:
	CWQG (µg/L) = e{0.76[ln(hardness)]+1.06}. At hardness >180 mg/L, the CWQG is 150 µg/L. If the hardness is unknown, the CWQG is 25 µg/L

6.5[A]	Concentration exceeds the indicated standard.
15.2	Measured concentration did not exceed the indicated standard.
<0.50	Laboratory reporting limit was greater than the applicable standard.
<0.03	Analyte was not detected at a concentration greater than the laboratory reporting limit.
n/v	No standard/guideline value.
-	Parameter not analyzed / not available.
EQ1	The short-term benchmark is for dissolved zinc and is calculated using the following equation: Benchmark = exp(0.833[ln(hardness mg·L-1)] + 0.240[ln(DOC mg·L-1)] + 0.526). The value in the table is for surface water of 50 mg CaCO3·L−1 hardness and 0.5 mg·L−1 dissolved organic carbon (DOC).
	The benchmark equation is valid between hardness 13.8 and 250.5 mg CaCO3·L−1 and DOC 0.3 and 17.3 mg·L−1.
EQ2	The long-term CWQG is for dissolved zinc and is calculated using the following equation: CWQG = exp(0.947[ln(hardness mg·L-1)] - 0.815[pH] + 0.398[ln(DOC mg·L-1)] + 4.625). The value in the table is for surface water of 50 mg CaCO3·L−1 hardness, pH of 7.5 and 0.5 mg·L−1 DOC.
	The CWQG equation is valid between hardness 23.4 and 399 mg CaCO3·L−1, pH 6.5 and 8.13 and DOC 0.3 to 22.9 mg·L−1.
EQ3	The short-term benchmark is calculated using the benchmark calculator in Appendix B of the Scientific Criteria Document for the Development of the Canadian Water Quality Guidelines for the Protection of Aquatic Life: Manganese or the following equation:
	Benchmark = exp(0.878[ln(hardness)] + 4.76) where the benchmark is expressed in dissolved manganese concentration (µg/L), and hardness is measured as CaCO3 equivalents in mg/L. The value in the table is for surface water of 50 mg/L hardness. The benchmark equation is valid between hardness 25 and 250 mg/L.
EQ4	The long-term CWQG is found using the look-up table (see Table 5) or the CWQG and benchmark calculator is Appendix B of CCME (2019). The value in the table is for surface water of 50 mg/L hardness and pH of 7.5. The CWQG table is valid between hardness 25 and 670 mg/L and pH 5.8 and 8.4.
LTG	The CWQG for cadmium (i.e. long-term guideline) of 0.09 µg·L-1 is for waters of 50 mg CaCO3·L-1 hardness. The CWQG for cadmium is related to water hardness (as CaCO3): When the water hardness is > 0 to < 17 mg/L, the CWQG is 0.04 µg/L; at hardness ≥ 17 to ≤ 280 mg/L, the CWQG is calculated using this equation (CWQG (µg/L) = 10^{0.83(log[hardness]) – 2.46 });
	At hardness > 280 mg/L, the CWQG is 0.37 µg/L.
n1	Guideline is expressed as Nitrite (as N) in ug/L. This value is equivalent to 197 ug/L for Nitrite.
s3	The PWQO for beryllium is hardness dependent. If hardness <75 mg/L than PWQO is 0.011 mg/L. For hardness > 75 mg/L, PWQO is 1.1 mg/L.
s2	Sulphate Guideline is hardness dependent. For hardness between 0-30 mg/L, guideline is 128 mg/L. For hardness between 31-75 mg/L, guideline is 218 mg/L. For hardness between 76-180 mg/L, guideline is 309 mg/L. For hardness between 181-250 mg/L, guideline is 429 mg/L. For hardness >250 mg/L, guideline is determined on a site specific basis.
	For hardness >250 mg/L and no site specific criteria is available, sampled were flagged as exceeding above 430mg/L.
s4	Applies to Phosphorus, total. PWQO is 0.03 mg/L for rivers and streams, 0.02 mg/L for lakes, and 0.01 mg/L for lakes naturally below this value.
s9	The PWQO for dissolved oxygen is both temperature and biota dependent. See page 17 of MOE (1994).
s12	The interim PWQO for cadmium is hardness dependent. If hardness <100 mg/L than PWQO is 0.0001 mg/L. For hardness >100 mg/L, PWQO is 0.0005 mg/L.
s13	The interim PWQO for copper is hardness dependent. If hardness <20 mg/L than PWQO is 0.001 mg/L. For hardness >20 mg/L, PWQO is 0.005 mg/L.
s14	PWQO for lead is alkalinity dependent. For alkalinity <20 mg/L, PWQO is 0.005 mg/L. For alkalinity between 20-40 mg/L, PWQO is 0.01 mg/L. For alkalinity between 40-80 mg/L, PWQO is 0.02 mg/L. For alkalinity >80 mg/L, PWQO is 0.025 mg/L.
s15	Interim PWQO for lead is hardness dependent. For hardness <30 mg/L, interim PWQO is 0.001 mg/L. For hardness between 30-80 mg/L, interim PWQO is 0.003 mg/L. For hardness >80 mg/L, interim PWQO is 0.005 mg/L.
s16	Alkalinity should not be decreased by more than 25% of the natural concentration.
STB	The short-term benchmark concentration of 1.0 µg·L-1 is for waters of 50 mg CaCO3·L-1 hardness. The short-term benchmark for cadmium is related to water hardness (as CaCO3): When the water hardness is 0 to < 5.3 mg/L, the short-term benchmark is 0.11 µg/L,
	At hardness ≥ 5.3 to ≤ 360 mg/L, the short-term benchmark is calculated using this equation (Short-term benchmark (µg/L) = 10^{1.016[log[hardness]) – 1.71 });
TBC1	Value is minimum value available. Sample-specific value to be calculated (equation).
VAR	Lowest acceptable dissolved oxygen concentration: for warm water biota: early life stages = 6000 µg/L; for warm water biota: other life stages = 5500 µg/L; for cold water biota: early life stages = 9500 µg/L; for cold water biota: other life stages = 6500 µg/L
VAR1	Variable, 5 µg/L if pH < 6.5 and 100 µg/L if pH > 6.5
*	The CWQG for copper is related to water hardness. When the water hardness is 0 to < 82 mg/L, the CWQG is 2 µg/L. At hardness ≥82 to ≤180 mg/L the CWQG is calculated using this equation:
	CWQG (µg/L) = 0.2 * e{0.8545[ln(hardness)]-1.465}. At hardness >180 mg/L, the CWQG is 4 µg/L. If the hardness is unknown, the CWQG is 2 µg/L
#	The CWQG for lead is related to water hardness. When the hardness is 0 to ≤ 60 mg/L, the CWQG is 1 µg/L. At hardness >60 to ≤ 180 mg/L the CWQG is calculated using this equation:
	CWQG (µg/L)= e{1.273[ln(hardness)]-4.705}. At hardness >180 mg/L, the CWQG is 7 µg/L. If the hardness is unknown, the CWQG is 1 µg/L
**	The CWQG for nickel is related to water hardness. When the water hardness is 0 to ≤ 60 mg/L, the CWQG is 25 µg/L. At hardness > 60 to ≤ 180 mg/L the CWQG is calculated using this equation:
	CWQG (µg/L) = e{0.76[ln(hardness)]+1.06}. At hardness >180 mg/L, the CWQG is 150 µg/L. If the hardness is unknown, the CWQG is 25 µg/L

Table
Summary of Surface Water Analytical Data
Crawford Project Preliminary Water Quality Assessment
Canadian Nickel Company

Notes:

CCME	Canadian Council of Ministers of the Environment
A	Canadian Environmental Quality Guidelines, Canadian Water Quality Guidelines for the Protection of Aquatic Life - Freshwater Aquatics Short Term
B	Canadian Environmental Quality Guidelines, Canadian Water Quality Guidelines for the Protection of Aquatic Life - Freshwater Aquatics Long Term
PWQO	Provincial Water Quality Objectives of the Ministry of Environment and Energy (MOEE, 1999)
C	PWQO Table 2
D	PWQO Table 2 - Calculated
E	PWQO Table 2 - Interim
BC MECC	British Columbia Ministry of Environment and Climate Change Strategy
F	BC Water Quality Guidelines to Protect Aquatic Life for Sulphate (2023)
6.5[A]	Concentration exceeds the indicated standard.
15.2	Measured concentration did not exceed the indicated standard.
<0.50	Laboratory reporting limit was greater than the applicable standard.
<0.03	Analyte was not detected at a concentration greater than the laboratory reporting limit.
n/v	No standard/guideline value.
-	Parameter not analyzed / not available.
a	This Interim PWQO was set for emergency purposes based on the best information readily available. Employ due caution when applying this value.
b	This Interim PWQO is currently under development. The value is subject to change upon publication by MOE.
EQ1	The short-term benchmark is for dissolved zinc and is calculated using the following equation: Benchmark = exp(0.833[ln(hardness mg·L-1)] + 0.240[ln(DOC mg·L-1)] + 0.526). The value in the table is for surface water of 50 mg CaCO3·L −1 hardness and 0.5 mg·L−1 dissolved organic carbon (DOC). The benchmark equation is valid between hardness 13.8 and 250.5 mg CaCO3·L−1 and DOC 0.3 and 17.3 mg·L−1.
EQ2	The long-term CWQG is for dissolved zinc and is calculated using the following equation: CWQG = exp(0.947[ln(hardness mg·L-1)] - 0.815[pH] + 0.398[ln(DOC mg·L-1)] + 4.625). The value in the table is for surface water of 50 mg CaCO3·L −1 hardness, pH of 7.5 and 0.5 mg·L−1 DOC. The CWQG equation is valid between hardness 23.4 and 399 mg CaCO3·L−1, pH 6.5 and 8.13 and DOC 0.3 to 22.9 mg·L−1.
EQ3	The short-term benchmark is calculated using the benchmark calculator in Appendix B of the Scientific Criteria Document for the Development of the Canadian Water Quality Guidelines for the Protection of Aquatic Life: Manganese or the following equation: Benchmark = exp(0.878[ln(hardness)] + 4.76) where the benchmark is expressed in dissolved manganese concentration (µg/L), and hardness is measured as CaCO3 equivalents in mg/L. The value in the table is for surface water of 50 mg/L hardness. The benchmark equation is valid between hardness 25 and 250 mg/L.
EQ4	The long-term CWQG is found using the look-up table (see Table 5) or the CWQG and benchmark calculator is Appendix B of CCME (2019). The value in the table is for surface water of 50 mg/L hardness and pH of 7.5. The CWQG table is valid between hardness 25 and 670 mg/L and pH 5.8 and 8.4.
LTG	The CWQG for cadmium (i.e. long-term guideline) of 0.09 µg·L-1 is for waters of 50 mg CaCO3·L-1 hardness. The CWQG for cadmium is related to water hardness (as CaCO3): When the water hardness is > 0 to < 17 mg/L, the CWQG is 0.04 µg/L; at hardness ≥ 17 to ≤ 280 mg/L, the CWQG is calculated using this equation (CWQG (µg/L) = 10^{0.83(log[hardness]) – 2.46 }); At hardness > 280 mg/L, the CWQG is 0.37 µg/L.
s2	Sulphate Guideline is hardness dependent. For hardness between 0-30 mg/L, guideline is 128 mg/L. For hardness between 31-75 mg/L, guideline is 218 mg/L. For hardness between 76-180 mg/L, guideline is 309 mg/L. For hardness between 181-250 mg/L, guideline is 429 mg/L. For hardness >250 mg/L, guideline is determined on a site specific basis.
s3	The PWQO for beryllium is hardness dependent. If hardness <75 mg/L than PWQO is 0.011 mg/L. For hardness > 75 mg/L, PWQO is 1.1 mg/L.
s4	Applies to Phosphorus, total. PWQO is 0.03 mg/L for rivers and streams, 0.02 mg/L for lakes, and 0.01 mg/L for lakes naturally below this value.
s6	Temperature at the edge of a mixing zone shall not exceed natural ambient water temperature by more than 10 deg C. The maximum temperature of the receiving body of water shall not exceed 30 deg C. See PWQO pg 25.
s12	The interim PWQO for cadmium is hardness dependent. If hardness <100 mg/L than PWQO is 0.0001 mg/L. For hardness >100 mg/L, PWQO is 0.0005 mg/L.
s13	The interim PWQO for copper is hardness dependent. If hardness <20 mg/L than PWQO is 0.001 mg/L. For hardness >20 mg/L, PWQO is 0.005 mg/L.
s14	PWQO for lead is alkalinity dependent. For alkalinity <20 mg/L, PWQO is 0.005 mg/L. For alkalinity between 20-40 mg/L, PWQO is 0.01 mg/L. For alkalinity between 40-80 mg/L, PWQO is 0.02 mg/L. For alkalinity >80 mg/L, PWQO is 0.025 mg/L.
s15	Interim PWQO for lead is hardness dependent. For hardness <30 mg/L, interim PWQO is 0.001 mg/L. For hardness between 30-80 mg/L, interim PWQO is 0.003 mg/L. For hardness >80 mg/L, interim PWQO is 0.005 mg/L.
SN	see Narrative
STB	The short-term benchmark concentration of 1.0 µg·L-1 is for waters of 50 mg CaCO3·L-1 hardness. The short-term benchmark for cadmium is related to water hardness (as CaCO3): When the water hardness is 0 to < 5.3 mg/L, the short-term benchmark is 0.11 µg/L, At hardness ≥ 5.3 to ≤ 360 mg/L, the short-term benchmark is calculated using this equation (Short-term benchmark (µg/L) = 10^{1.016(log[hardness]) – 1.71 }); At hardness > 360 mg/L, the short-term benchmark is 7.7 µg/L.
TBC1	Value is minimum value available. Sample-specific value to be calculated (equation).
TBC2	To be calculated (equation), then the present guideline values (mg/L NH3) can be converted to mg/L total ammonia-N by multiplying the corresponding guideline value by 0.8224.
VAR1	Variable, 5 µg/L if pH < 6.5 and 100 µg/L if pH > 6.5

Appendix B.7 Local Water Quality Field Measurements

** Detection Limit for result exceeds Guideline Limit. Assessment against Guideline Limit cannot be made.
* Analytical result for this parameter exceeds Guideline Limit listed on this report. Guideline Limits applied:

Ontario PWQO (1994 + Federal CCME (JUN,2018) and Ontario R153 Guidelines (2011) = [Suite] - ON-PWQO+CCME-FAL-WATER

#1: Federal CCME Freshwater Aquatic Life (FAL)

#2: Ontario PWQO 1994 Guidelines

Reference Information

Sample Parameter Qualifier key listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLRC	Detection Limit Raised for RadioChemistry test due to sample matrix (e.g. high TDS) or instrument detector conditions.
HTC	Hardness was calculated from Total Ca and/or Mg concentrations and may be biased high (dissolved Ca/Mg results unavailable).

Methods Listed (if applicable):

ALS Test Code	Matrix	Test Description	Method Reference***
ACIDITY-WT	Water	Acidity (as CaCO3)	APHA 2310 B - Potentiometric Titration
ALK-WT	Water	Alkalinity, Total (as CaCO3)	APHA 2320B

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint.

BR-IC-N-WT	Water	Bromide in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

CL-IC-N-WT	Water	Chloride by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CN-FREE-CFA-WT	Water	Free Cyanide in water by CFA	ASTM 7237

This analysis is carried out using procedures adapted from ASTM Method 7237 "Free Cyanide with Flow Injection Analysis (FIA) Utilizing Gas Diffusion Separation and Amperometric Detection". Free cyanide is determined by in-line gas diffusion at pH 6 with final determination by colourimetric analysis.

CN-TOT-WT	Water	Cyanide, Total	ISO 14403-2

Total cyanide is determined by the combination of UV digestion and distillation. Cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

When using this method, high levels of thiocyanate in samples can cause false positives at ~1-2% of the thiocyanate concentration. For samples with detectable cyanide analyzed by this method, ALS recommends analysis for thiocyanate to check for this potential interference

CN-WAD-WT	Water	Cyanide, Weak Acid Diss	APHA 4500CN I-Weak acid Dist Colorimet

Weak acid dissociable cyanide (WAD) is determined by undergoing a distillation procedure. Cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

EC-SCREEN-WT	Water	Conductivity Screen (Internal Use Only)	APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

EC-WT	Water	Conductivity	APHA 2510 B

Water samples can be measured directly by immersing the conductivity cell into the sample.

F-IC-N-WT	Water	Fluoride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

HARDNESS-CALC-WT	Water	Hardness	APHA 2340 B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-T-U-CVAF-VA	Water	Total Mercury in Water by CVAFS (Ultra)	EPA 1631 REV. E

This analysis is carried out using procedures adapted from Method 1631 Rev. E. by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to a purge and trap concentration step and final reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry.

MEHG-T-GCAF-VA	Water	Total Methylmercury in Water by GCAFS	EPA 1630

This method follows Method 1630 of the US EPA. Samples are distilled under an inert gas flow to isolate methylmercury and minimize matrix interferences. The distillate is analyzed by aqueous phase ethylation, purge and trap, desorption and GC separation. The separated species are then pyrolized to elemental Hg and quantified by cold vapour atomic flourescence spectroscopy. Results are reported "as MeHg".

MET-D-CCMS-WP	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020B (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Reference Information

MET-T-CCMS-WT	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

NH3-F-WT	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-IC-WT	Water	Nitrite in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT	Water	Nitrate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-L-COL-WP	Water	Phosphorus, Total	APHA 4500 P PHOSPHORUS-L

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-WT	Water	pH	APHA 4500 H-Electrode

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011). Holdtime for samples under this regulation is 28 days

RA226-MMER-FC	Water	Ra226 by Alpha Scint, MDC=0.01 Bq/L	EPA 903.1
SO4-IC-N-WT	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SOLIDS-TDS-WT	Water	Total Dissolved Solids	APHA 2540C

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

SOLIDS-TSS-WT	Water	Suspended solids	APHA 2540 D-Gravimetric

A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1°C for a minimum of four hours or until a constant weight is achieved.

*** ALS test methods may incorporate modifications from specified reference methods to improve performance.

Chain of Custody numbers:

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location	Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA	FC	ALS ENVIRONMENTAL - FORT COLLINS, COLORADO, USA
WP	ALS ENVIRONMENTAL - WINNIPEG, MANITOBA, CANADA	VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Reference Information

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, fitness for a particular purpose, or non-infringement. ALS assumes no responsibility for errors or omissions in the information. Guideline limits are not adjusted for the hardness, pH or temperature of the sample (the most conservative values are used). Measurement uncertainty is not applied to test results prior to comparison with specified criteria values.

Quality Control Report

Workorder: L2623628 Report Date: 21-SEP-21

Client: Wood Environment & Infrastructure Solutions
160 Traders Blvd. East, Suite 110
Mississauga ON L4Z 3K7
Contact: Dale Klodnicki

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Re: ALS Workorder: 2108320
Project Name:
Project Number: L2623628

Dear Braun:

One water sample was received from ALS Environmental, on 8/16/2021. The sample was scheduled for the following analysis:

Radium-226

The results for these analyses are contained in the enclosed reports.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained from ALS Environmental.

Thank you for your confidence in ALS Environmental. Should you have any questions, please call.

Sincerely,

<original signed by> tor,

ALS Environmental
Katie M. OBrien
Project Manager

Accreditations: ALS Environmental – Fort Collins is accredited by the following accreditation bodies for various testing scopes in accordance with requirements of each accreditation body. All testing is performed under the laboratory management system, which is maintained to meet these requirement and regulations. Please contact the laboratory or accreditation body for the current scope testing parameters.

ALS Environmental – Fort Collins	
Accreditation Body	License or Certification Number
California (CA)	2926
Colorado (CO)	CO01099
Florida (FL)	E87914

Analyses	Result	Qual	Report Limit	Units	Dilution Factor	Date Analyzed

Explanation of Qualifiers

Radiochemistry:

- "Report Limit" is the MDC

U or ND - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

W - DER is greater than Warning Limit of 1.42

* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
# - Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.
G - Sample density differs by more than 15% of LCS density.
D - DER is greater than Control Limit

M - Requested MDC not met.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.

H - LCS Recovery above upper control limit.

P - LCS, Matrix Spike Recovery within control limits.

N - Matrix Spike Recovery outside control limits

NC - Not Calculated for duplicate results less than 5 times MDC

B - Analyte concentration greater than MDC.

B3 - Analyte concentration greater than MDC but less than Requested MDC.

Inorganics:

B - Result is less than the requested reporting limit but greater than the instrument method detection limit (MDL).

U or ND - Indicates that the compound was analyzed for but not detected.

E - The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.

M - Duplicate injection precision was not met.

N - Spiked sample recovery not within control limits. A post spike is analyzed for all ICP analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than four times the spike added concentration.

Z - Spiked recovery not within control limits. An explanatory note may be included in the narrative.

* - Duplicate analysis (relative percent difference) not within control limits.

S - SAR value is estimated as one or more analytes used in the calculation were not detected above the detection limit.

Organics:

U or ND - Indicates that the compound was analyzed for but not detected.

B - Analyte is detected in the associated method blank as well as in the sample. It indicates probable blank contamination and warns the data user.

E - Analyte concentration exceeds the upper level of the calibration range.

J - Estimated value. The result is less than the reporting limit but greater than the instrument method detection limit (MDL).

A - A tentatively identified compound is a suspected aldol-condensation product.

X - The analyte was diluted below an accurate quantitation level.

* - The spike recovery is equal to or outside the control criteria used.

+ - The relative percent difference (RPD) equals or exceeds the control criteria.

G - A pattern resembling gasoline was detected in this sample.

D - A pattern resembling diesel was detected in this sample.

M - A pattern resembling motor oil was detected in this sample.

C - A pattern resembling crude oil was detected in this sample.

4 - A pattern resembling JP-4 was detected in this sample.

5 - A pattern resembling JP-5 was detected in this sample.

H - Indicates that the fuel pattern was in the heavier end of the retention time window for the analyte of interest.

L - Indicates that the fuel pattern was in the lighter end of the retention time window for the analyte of interest.

Z - This flag indicates that a significant fraction of the reported result did not resemble the patterns of any of the following petroleum hydrocarbon products:
- gasoline
- JP-8
- diesel
- mineral spirits
- motor oil
- Stoddard solvent
- bunker C

☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimum
☐ Same day [E2] if received by 10am M-S - 200% rush surcharge.

Additional fees may apply to rush requests on weekends, statutory holidays and for non-routine tests.

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

Reference Information

Sample Parameter Qualifier key listed:

Qualifier	Description
RRV	Reported Result Verified By Repeat Analysis
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
PEHR	Parameter Exceeded Recommended Holding Time On Receipt: Proceed With Analysis As Requested.
HTC	Hardness was calculated from Total Ca and/or Mg concentrations and may be biased high (dissolved Ca/Mg results unavailable).

Methods Listed (if applicable):

ALS Test Code	Matrix	Test Description	Method Reference***
ACIDITY-WT	Water	Acidity (as CaCO3)	APHA 2310 B - Potentiometric Titration
ALK-WT	Water	Alkalinity, Total (as CaCO3)	APHA 2320B

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint.

BR-IC-N-WT	Water	Bromide in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

CL-IC-N-WT	Water	Chloride by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CN-FREE-CFA-WT	Water	Free Cyanide in water by CFA	ASTM 7237

This analysis is carried out using procedures adapted from ASTM Method 7237 "Free Cyanide with Flow Injection Analysis (FIA) Utilizing Gas Diffusion Separation and Amperometric Detection". Free cyanide is determined by in-line gas diffusion at pH 6 with final determination by colourimetric analysis.

CN-TOT-WT	Water	Cyanide, Total	ISO 14403-2

Total cyanide is determined by the combination of UV digestion and distillation. Cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

When using this method, high levels of thiocyanate in samples can cause false positives at ~1-2% of the thiocyanate concentration. For samples with detectable cyanide analyzed by this method, ALS recommends analysis for thiocyanate to check for this potential interference

CN-WAD-WT	Water	Cyanide, Weak Acid Diss	APHA 4500CN I-Weak acid Dist Colorimet

Weak acid dissociable cyanide (WAD) is determined by undergoing a distillation procedure. Cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

EC-SCREEN-WT	Water	Conductivity Screen (Internal Use Only)	APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

EC-WT	Water	Conductivity	APHA 2510 B

Water samples can be measured directly by immersing the conductivity cell into the sample.

F-IC-N-WT	Water	Fluoride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

HARDNESS-CALC-WT	Water	Hardness	APHA 2340 B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-T-U-CVAF-VA	Water	Total Mercury in Water by CVAFS (Ultra)	EPA 1631 REV. E

This analysis is carried out using procedures adapted from Method 1631 Rev. E. by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to a purge and trap concentration step and final reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry.

MEHG-T-GCAF-VA	Water	Total Methylmercury in Water by GCAFS	EPA 1630

This method follows Method 1630 of the US EPA. Samples are distilled under an inert gas flow to isolate methylmercury and minimize matrix interferences. The distillate is analyzed by aqueous phase ethylation, purge and trap, desorption and GC separation. The separated species are then pyrolized to elemental Hg and quantified by cold vapour atomic flourescence spectroscopy. Results are reported "as MeHg".

MET-D-CCMS-WP	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020B (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Reference Information

MET-T-CCMS-WT	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

NH3-F-WT	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-IC-WT	Water	Nitrite in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT	Water	Nitrate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-L-COL-WP	Water	Phosphorus, Total	APHA 4500 P PHOSPHORUS-L

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-WT	Water	pH	APHA 4500 H-Electrode

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011). Holdtime for samples under this regulation is 28 days

SO4-IC-N-WT	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SOLIDS-TDS-WT	Water	Total Dissolved Solids	APHA 2540C

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

SOLIDS-TSS-WT	Water	Suspended solids	APHA 2540 D-Gravimetric

A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1°C for a minimum of four hours or until a constant weight is achieved.

*** ALS test methods may incorporate modifications from specified reference methods to improve performance.

Chain of Custody numbers:

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location	Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA	WP	ALS ENVIRONMENTAL - WINNIPEG, MANITOBA, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA		

Reference Information

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, fitness for a particular purpose, or non-infringement. ALS assumes no responsibility for errors or omissions in the information. Guideline limits are not adjusted for the hardness, pH or temperature of the sample (the most conservative values are used). Measurement uncertainty is not applied to test results prior to comparison with specified criteria values.

Hold Time Exceedances:

ALS Product Description	Sample ID	Sampling Date	Date Processed	Rec. HT	Actual HT	Units	Qualifier
Physical Tests							
pH							
	3	06-AUG-21 13:15	12-AUG-21 00:00	4	5	days	EHTR

Legend & Qualifier Definitions:

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR: Exceeded ALS recommended hold time prior to sample receipt.
EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT: Exceeded ALS recommended hold time prior to analysis.
Rec. HT: ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2625067 were received on 11-AUG-21 09:00.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Re: ALS Workorder: 2108328
Project Name:
Project Number: L2625067

Dear Braun:

Two water samples were received from ALS Environmental, on 8/16/2021. The samples were scheduled for the following analysis:

Radium-226

The results for these analyses are contained in the enclosed reports.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained from ALS Environmental.

Thank you for your confidence in ALS Environmental. Should you have any questions, please call.

Sincerely,

<original signed by>
For
ALS Environmental
Katie M. OBrien
Project Manager

Accreditations: ALS Environmental – Fort Collins is accredited by the following accreditation bodies for various testing scopes in accordance with requirements of each accreditation body. All testing is performed under the laboratory management system, which is maintained to meet these requirement and regulations. Please contact the laboratory or accreditation body for the current scope testing parameters.

ALS Environmental – Fort Collins	
Accreditation Body	License or Certification Number
California (CA)	2926
Colorado (CO)	CO01099
Florida (FL)	E87914

10.	Are samples in proper containers for requested analyses? (form 250, *Sample Handling Guidelines*)		X	
11.	Are all aqueous samples preserved correctly, if required? (excluding volatiles)		X	
12.	Are all samples requiring no headspace (VOC, GRO, RSK/MEE, radon) free of bubbles > 6 mm (1/4 inch) diameter? (i.e. size of green pea)	X		
13.	Were the samples shipped on ice?		X	
14.	Were cooler temperatures measured at 0.1-6.0°C? IR gun used*: #5	RAD ONLY		X

Cooler #:	1						
Temperature (°C):	23.4						
# of custody seals on cooler:	0						
External µR/hr reading:	11						
Background µR/hr reading:	13						

Were external µR/hr readings ≤ two times background and within DOT acceptance criteria? **YES** (If no, see Form 008.)

*** Please provide details here for NO responses to boxes above - for 2 thru 5 & 7 thru 12, notify PM & continue w/ login.**

Were unpreserved bottles pH checked? NA All client bottle ID's vs ALS lab ID's double-checked by: AK

If applicable, was the client contacted? **NA** Contact: _____ Date/Time: _____

Project Manager Signature / Date: _____<original signed by> 8/20/21

Analyses	Result	Qual	Report Limit	Units	Dilution Factor	Date Analyzed

Explanation of Qualifiers

Radiochemistry:

- "Report Limit" is the MDC

U or ND - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

W - DER is greater than Warning Limit of 1.42

* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
# - Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.
G - Sample density differs by more than 15% of LCS density.
D - DER is greater than Control Limit

M - Requested MDC not met.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.

H - LCS Recovery above upper control limit.

P - LCS, Matrix Spike Recovery within control limits.

N - Matrix Spike Recovery outside control limits

NC - Not Calculated for duplicate results less than 5 times MDC

B - Analyte concentration greater than MDC.

B3 - Analyte concentration greater than MDC but less than Requested MDC.

Inorganics:

B - Result is less than the requested reporting limit but greater than the instrument method detection limit (MDL).

U or ND - Indicates that the compound was analyzed for but not detected.

E - The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.

M - Duplicate injection precision was not met.

N - Spiked sample recovery not within control limits. A post spike is analyzed for all ICP analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than four times the spike added concentration.

Z - Spiked recovery not within control limits. An explanatory note may be included in the narrative.

* - Duplicate analysis (relative percent difference) not within control limits.

S - SAR value is estimated as one or more analytes used in the calculation were not detected above the detection limit.

Organics:

U or ND - Indicates that the compound was analyzed for but not detected.

B - Analyte is detected in the associated method blank as well as in the sample. It indicates probable blank contamination and warns the data user.

E - Analyte concentration exceeds the upper level of the calibration range.

J - Estimated value. The result is less than the reporting limit but greater than the instrument method detection limit (MDL).

A - A tentatively identified compound is a suspected aldol-condensation product.

X - The analyte was diluted below an accurate quantitation level.

* - The spike recovery is equal to or outside the control criteria used.

+ - The relative percent difference (RPD) equals or exceeds the control criteria.

G - A pattern resembling gasoline was detected in this sample.

D - A pattern resembling diesel was detected in this sample.

M - A pattern resembling motor oil was detected in this sample.

C - A pattern resembling crude oil was detected in this sample.

4 - A pattern resembling JP-4 was detected in this sample.

5 - A pattern resembling JP-5 was detected in this sample.

H - Indicates that the fuel pattern was in the heavier end of the retention time window for the analyte of interest.

L - Indicates that the fuel pattern was in the lighter end of the retention time window for the analyte of interest.

Z - This flag indicates that a significant fraction of the reported result did not resemble the patterns of any of the following petroleum hydrocarbon products:
- gasoline
- JP-8
- diesel
- mineral spirits
- motor oil
- Stoddard solvent
- bunker C

Reference Information

Sample Parameter Qualifier key listed:

Qualifier	Description
RRV	Reported Result Verified By Repeat Analysis
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
HTD	Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time.
HTC	Hardness was calculated from Total Ca and/or Mg concentrations and may be biased high (dissolved Ca/Mg results unavailable).
NR:PH8	No Result: No Acidity, pH Of Sample >8.3

Methods Listed (if applicable):

ALS Test Code	Matrix	Test Description	Method Reference***
ACIDITY-WT	Water	Acidity (as CaCO3)	APHA 2310 B - Potentiometric Titration
ALK-WT	Water	Alkalinity, Total (as CaCO3)	APHA 2320B

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint.

BR-IC-N-WT	Water	Bromide in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

CL-IC-N-WT	Water	Chloride by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CN-FREE-CFA-WT	Water	Free Cyanide in water by CFA	ASTM 7237

This analysis is carried out using procedures adapted from ASTM Method 7237 "Free Cyanide with Flow Injection Analysis (FIA) Utilizing Gas Diffusion Separation and Amperometric Detection". Free cyanide is determined by in-line gas diffusion at pH 6 with final determination by colourimetric analysis.

CN-TOT-WT	Water	Cyanide, Total	ISO 14403-2

Total cyanide is determined by the combination of UV digestion and distillation. Cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

When using this method, high levels of thiocyanate in samples can cause false positives at ~1-2% of the thiocyanate concentration. For samples with detectable cyanide analyzed by this method, ALS recommends analysis for thiocyanate to check for this potential interference

CN-WAD-WT	Water	Cyanide, Weak Acid Diss	APHA 4500CN I-Weak acid Dist Colorimet

Weak acid dissociable cyanide (WAD) is determined by undergoing a distillation procedure. Cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

EC-SCREEN-WT	Water	Conductivity Screen (Internal Use Only)	APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

EC-WT	Water	Conductivity	APHA 2510 B

Water samples can be measured directly by immersing the conductivity cell into the sample.

F-IC-N-WT	Water	Fluoride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

HARDNESS-CALC-WT	Water	Hardness	APHA 2340 B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-T-U-CVAF-VA	Water	Total Mercury in Water by CVAFS (Ultra)	EPA 1631 REV. E

This analysis is carried out using procedures adapted from Method 1631 Rev. E. by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to a purge and trap concentration step and final reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry.

MEHG-T-GCAF-VA	Water	Total Methylmercury in Water by GCAFS	EPA 1630

This method follows Method 1630 of the US EPA. Samples are distilled under an inert gas flow to isolate methylmercury and minimize matrix interferences. The distillate is analyzed by aqueous phase ethylation, purge and trap, desorption and GC separation. The separated species are then pyrolized to elemental Hg and quantified by cold vapour atomic flourescence spectroscopy. Results are reported "as MeHg".

Reference Information

MET-D-CCMS-WP	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020B (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-WT	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

NH3-COL-WP	Water	Ammonia by colour	APHA 4500 NH3 F

Ammonia in water samples forms indophenol when reacted with hypochlorite and phenol. The intensity is amplified by the addition of sodium nitroprusside and measured colourmetrically.

NH3-F-WT	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-IC-WT	Water	Nitrite in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT	Water	Nitrate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-L-COL-WP	Water	Phosphorus, Total	APHA 4500 P PHOSPHORUS-L

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-WT	Water	pH	APHA 4500 H-Electrode

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011). Holdtime for samples under this regulation is 28 days

SO4-IC-N-WT	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SOLIDS-TDS-WT	Water	Total Dissolved Solids	APHA 2540C

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

SOLIDS-TSS-WT	Water	Suspended solids	APHA 2540 D-Gravimetric

A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1°C for a minimum of four hours or until a constant weight is achieved.

*** ALS test methods may incorporate modifications from specified reference methods to improve performance.

Chain of Custody numbers:

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location	Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA	WP	ALS ENVIRONMENTAL - WINNIPEG, MANITOBA, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA		

Reference Information

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, fitness for a particular purpose, or non-infringement. ALS assumes no responsibility for errors or omissions in the information. Guideline limits are not adjusted for the hardness, pH or temperature of the sample (the most conservative values are used). Measurement uncertainty is not applied to test results prior to comparison with specified criteria values.

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2626399 were received on 13-AUG-21 09:00.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Re: ALS Workorder: 2108319
Project Name:
Project Number: L2626399

Dear Braun:

Four water samples were received from ALS Environmental, on 8/16/2021. The samples were scheduled for the following analysis:

Radium-226

The results for these analyses are contained in the enclosed reports.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained from ALS Environmental.

Thank you for your confidence in ALS Environmental. Should you have any questions, please call.

Sincerely,
<original signed by>

For

ALS Environmental
Katie M. OBrien
Project Manager

Accreditations: ALS Environmental – Fort Collins is accredited by the following accreditation bodies for various testing scopes in accordance with requirements of each accreditation body. All testing is performed under the laboratory management system, which is maintained to meet these requirement and regulations. Please contact the laboratory or accreditation body for the current scope testing parameters.

ALS Environmental – Fort Collins	
Accreditation Body	License or Certification Number
California (CA)	2926
Colorado (CO)	CO01099
Florida (FL)	E87914
Idaho (ID)	CO01099
Kansas (KS)	E-10381
Kentucky (KY)	90137

Analyses	Result	Qual	Report Limit	Units	Dilution Factor	Date Analyzed

Explanation of Qualifiers

Radiochemistry:

- "Report Limit" is the MDC

U or ND - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

W - DER is greater than Warning Limit of 1.42

* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
# - Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.
G - Sample density differs by more than 15% of LCS density.
D - DER is greater than Control Limit

M - Requested MDC not met.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.

H - LCS Recovery above upper control limit.

P - LCS, Matrix Spike Recovery within control limits.

N - Matrix Spike Recovery outside control limits

NC - Not Calculated for duplicate results less than 5 times MDC

B - Analyte concentration greater than MDC.

B3 - Analyte concentration greater than MDC but less than Requested MDC.

Inorganics:

B - Result is less than the requested reporting limit but greater than the instrument method detection limit (MDL).

U or ND - Indicates that the compound was analyzed for but not detected.

E - The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.

M - Duplicate injection precision was not met.

N - Spiked sample recovery not within control limits. A post spike is analyzed for all ICP analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than four times the spike added concentration.

Z - Spiked recovery not within control limits. An explanatory note may be included in the narrative.

* - Duplicate analysis (relative percent difference) not within control limits.

S - SAR value is estimated as one or more analytes used in the calculation were not detected above the detection limit.

Organics:

U or ND - Indicates that the compound was analyzed for but not detected.

B - Analyte is detected in the associated method blank as well as in the sample. It indicates probable blank contamination and warns the data user.

E - Analyte concentration exceeds the upper level of the calibration range.

J - Estimated value. The result is less than the reporting limit but greater than the instrument method detection limit (MDL).

A - A tentatively identified compound is a suspected aldol-condensation product.

X - The analyte was diluted below an accurate quantitation level.

* - The spike recovery is equal to or outside the control criteria used.

+ - The relative percent difference (RPD) equals or exceeds the control criteria.

G - A pattern resembling gasoline was detected in this sample.

D - A pattern resembling diesel was detected in this sample.

M - A pattern resembling motor oil was detected in this sample.

C - A pattern resembling crude oil was detected in this sample.

4 - A pattern resembling JP-4 was detected in this sample.

5 - A pattern resembling JP-5 was detected in this sample.

H - Indicates that the fuel pattern was in the heavier end of the retention time window for the analyte of interest.

L - Indicates that the fuel pattern was in the lighter end of the retention time window for the analyte of interest.

Z - This flag indicates that a significant fraction of the reported result did not resemble the patterns of any of the following petroleum hydrocarbon products:
- gasoline
- JP-8
- diesel
- mineral spirits
- motor oil
- Stoddard solvent
- bunker C

Matrix Spike	Strontium (Sr)-Total	MS-B	L2655497-3
Matrix Spike	Strontium (Sr)-Total	MS-B	L2655497-4, -5, -6, -7
Matrix Spike	Sulfur (S)-Total	MS-B	L2655497-3
Matrix Spike	Titanium (Ti)-Total	MS-B	L2655497-4, -5, -6, -7
Matrix Spike	Uranium (U)-Total	MS-B	L2655497-3
Matrix Spike	Phosphorus (P)-Total	MS-B	L2655497-1, -2, -3, -4, -5, -6, -7

Sample Parameter Qualifier key listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
HTC	Hardness was calculated from Total Ca and/or Mg concentrations and may be biased high (dissolved Ca/Mg results unavailable).
HTD	Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
PEHT	Parameter Exceeded Recommended Holding Time Prior to Analysis

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACIDITY-WT	Water	Acidity (as CaCO3)	APHA 2310 B - Potentiometric Titration
ALK-WT	Water	Alkalinity, Total (as CaCO3)	APHA 2320B

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint.

BR-IC-N-WT	Water	Bromide in Water by IC	EPA 300.1 (mod)

Reference Information

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

CL-IC-N-WT	Water	Chloride by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CN-FREE-CFA-WT	Water	Free Cyanide in water by CFA	ASTM 7237

This analysis is carried out using procedures adapted from ASTM Method 7237 "Free Cyanide with Flow Injection Analysis (FIA) Utilizing Gas Diffusion Separation and Amperometric Detection". Free cyanide is determined by in-line gas diffusion at pH 6 with final determination by colourimetric analysis.

CN-TOT-WT	Water	Cyanide, Total	ISO 14403-2

Total cyanide is determined by the combination of UV digestion and distillation. Cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

When using this method, high levels of thiocyanate in samples can cause false positives at ~1-2% of the thiocyanate concentration. For samples with detectable cyanide analyzed by this method, ALS recommends analysis for thiocyanate to check for this potential interference

CN-WAD-WT	Water	Cyanide, Weak Acid Diss	APHA 4500CN I-Weak acid Dist Colorimet

Weak acid dissociable cyanide (WAD) is determined by undergoing a distillation procedure. Cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

EC-SCREEN-WT	Water	Conductivity Screen (Internal Use Only)	APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

EC-WT	Water	Conductivity	APHA 2510 B

Water samples can be measured directly by immersing the conductivity cell into the sample.

F-IC-N-WT	Water	Fluoride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

HARDNESS-CALC-WT	Water	Hardness	APHA 2340 B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-T-U-CVAF-VA	Water	Total Mercury in Water by CVAFS (Ultra)	EPA 1631 REV. E

This analysis is carried out using procedures adapted from Method 1631 Rev. E. by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to a purge and trap concentration step and final reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry.

MEHG-T-GCAF-VA	Water	Total Methylmercury in Water by GCAFS	EPA 1630 (mod)

This method follows Method 1630 of the US EPA. Samples are distilled under an inert gas flow to isolate methylmercury and minimize matrix interferences. The distillate is analyzed by aqueous phase ethylation, purge and trap, desorption and GC separation. The separated species are then pyrolized to elemental Hg and quantified by cold vapour atomic flourescence spectroscopy. Results are reported "as MeHg".

MET-D-CCMS-WP	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020B (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-WT	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

NH3-COL-WP	Water	Ammonia by colour	APHA 4500 NH3 F

Reference Information

Ammonia in water samples forms indophenol when reacted with hypochlorite and phenol. The intensity is amplified by the addition of sodium nitroprusside and measured colourmetrically.

NO2-IC-WT	Water	Nitrite in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT	Water	Nitrate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-L-COL-WP	Water	Phosphorus, Total	APHA 4500 P PHOSPHORUS-L

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-WT	Water	pH	APHA 4500 H-Electrode

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011). Holdtime for samples under this regulation is 28 days

SO4-IC-N-WT	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SOLIDS-TDS-WT	Water	Total Dissolved Solids	APHA 2540C

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

SOLIDS-TSS-WT	Water	Suspended solids	APHA 2540 D-Gravimetric

A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1°C for a minimum of four hours or until a constant weight is achieved.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
WP	ALS ENVIRONMENTAL - WINNIPEG, MANITOBA, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Workorder: L2655497 Report Date: 18-NOV-21

Client: Wood Environment & Infrastructure Solutions
160 Traders Blvd. East, Suite 110
Mississauga ON L4Z 3K7
Contact: Dale Klodnicki

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Legend & Qualifier Definitions:

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR: Exceeded ALS recommended hold time prior to sample receipt.
EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT: Exceeded ALS recommended hold time prior to analysis.
Rec. HT: ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2655497 were received on 26-OCT-21 09:50.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.
